

MikroTik RouterOS Training

Routing

Instructors

- Ziad Sobri, MTCNA, MTCRE, MTCTCE, MTCWE, MTCUME, MTCINE, MikroTik Certified Trainer, MikroTik Academy Trainer, MikroTik Academy Coordinator
- Working with RouterOS since 2007
- Other Certifications :
 - Cisco Certified Network Associate (CCNA)
 - Juniper Network Certified Internetworking Associate (JNCIA), Juniper Network Certified Internetworking Specialist – Service Provider (JNCIS-SP)
 - Ubiquiti Broadband Wireless Specialist (UBWS), Ubiquiti Broadband Wireless Admin (UBWA), Ubiquiti Enterprise Wireless Admin (UEWA), Ubiquiti Certified Trainer

Housekeeping

- Course materials
- Routers, cables
- Break times and lunch
- Restrooms and smoking area locations

Course Objective

- Provide thorough knowledge and hands-on training for MikroTik RouterOS basic and advanced routing capabilities for small and medium size networks
- Upon completion of the course you will be able to plan, implement, adjust and debug routed MikroTik RouterOS network configurations.

Introduce Yourself

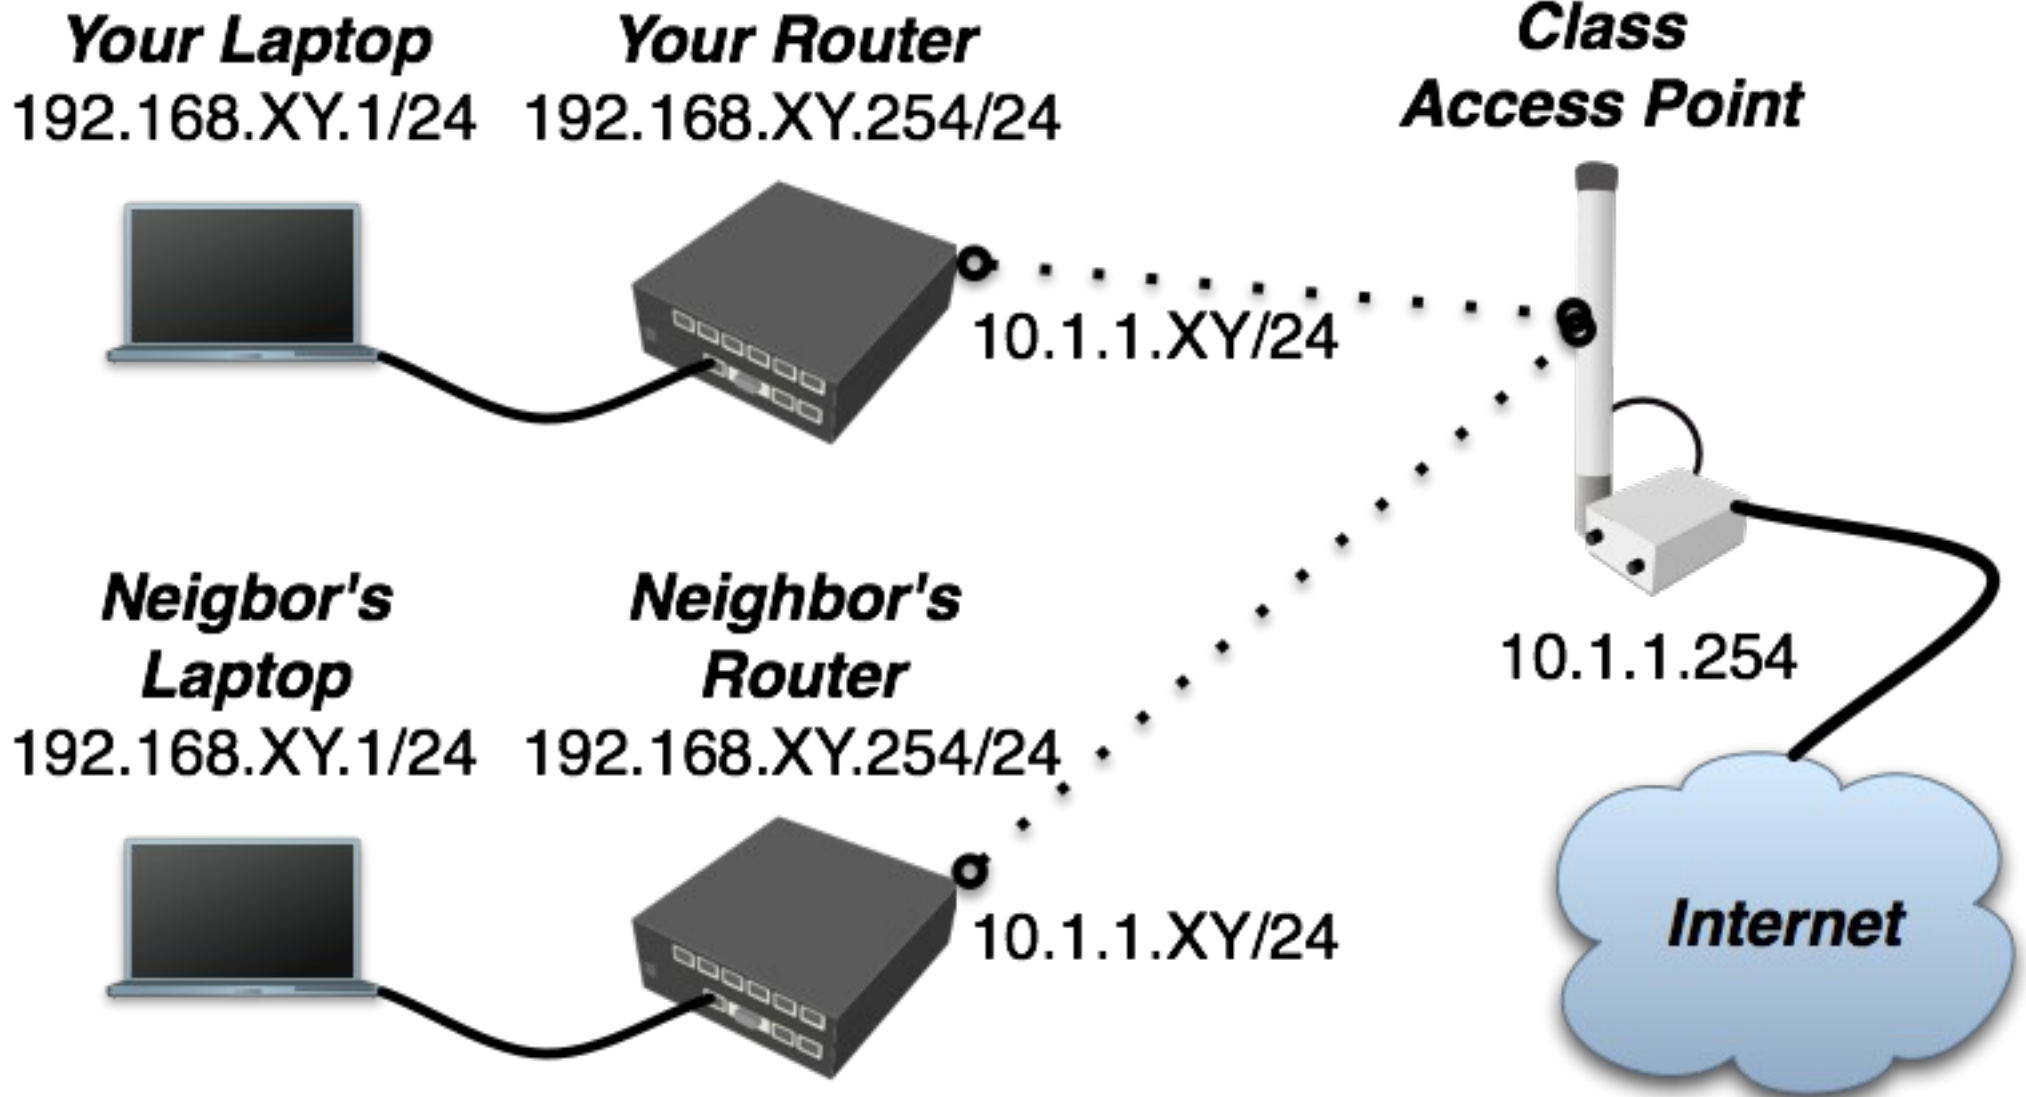

- Please, introduce yourself to the class
 - ◆ Your name
 - ◆ Your Company
 - ◆ Your previous knowledge about RouterOS
 - ◆ Your previous knowledge about networking
 - ◆ What do you expect from this course?
- Please, remember your class XY number.
(X is number of the row, Y is your seat number in the row)

My number is: _____

Class Setup Lab

- Create an 192.168.XY.0/24 Ethernet network between the laptop (.1) and the router (.254)
- Connect routers to the AP SSID “ap_rb532”
- Assign IP address 10.1.1.XY/24 to the wlan1
- Main GW and DNS address is 10.1.1.254
- Gain access to the internet from your laptops via local router
- Create new user for your router and change “admin” access rights to “read”

Class Setup

Class setup Lab (cont.)

- Set system identity of the board and wireless radio name to “XY_<your_name>”. Example: **“00_Janis”**
- Upgrade your router to the latest Mikrotik RouterOS version
- Upgrade your Winbox loader version
- Set up NTP client – use 10.1.1.254 as server
- Create a configuration **backup** and copy it to the laptop (it will be default configuration)

Simple Routing

Distance, Policy Routing, ECMP, Scope,
Dead-End and Recursive Next-Hop
Resolving

Simple Static Route

The screenshot shows the 'New Route' dialog box with the following configuration:

- Destination: 192.168.XY.0/24
- Gateway: 192.168.Z.1
- Interface: (empty)
- Check Gateway: (dropdown)
- Type: unicast
- Distance: (dropdown)
- Scope: 255
- Target Scope: 10
- Routing Mark: (dropdown)
- Pref. Source: (dropdown)

Buttons on the right: OK, Cancel, Apply, Disable, Comment, Copy, Remove.

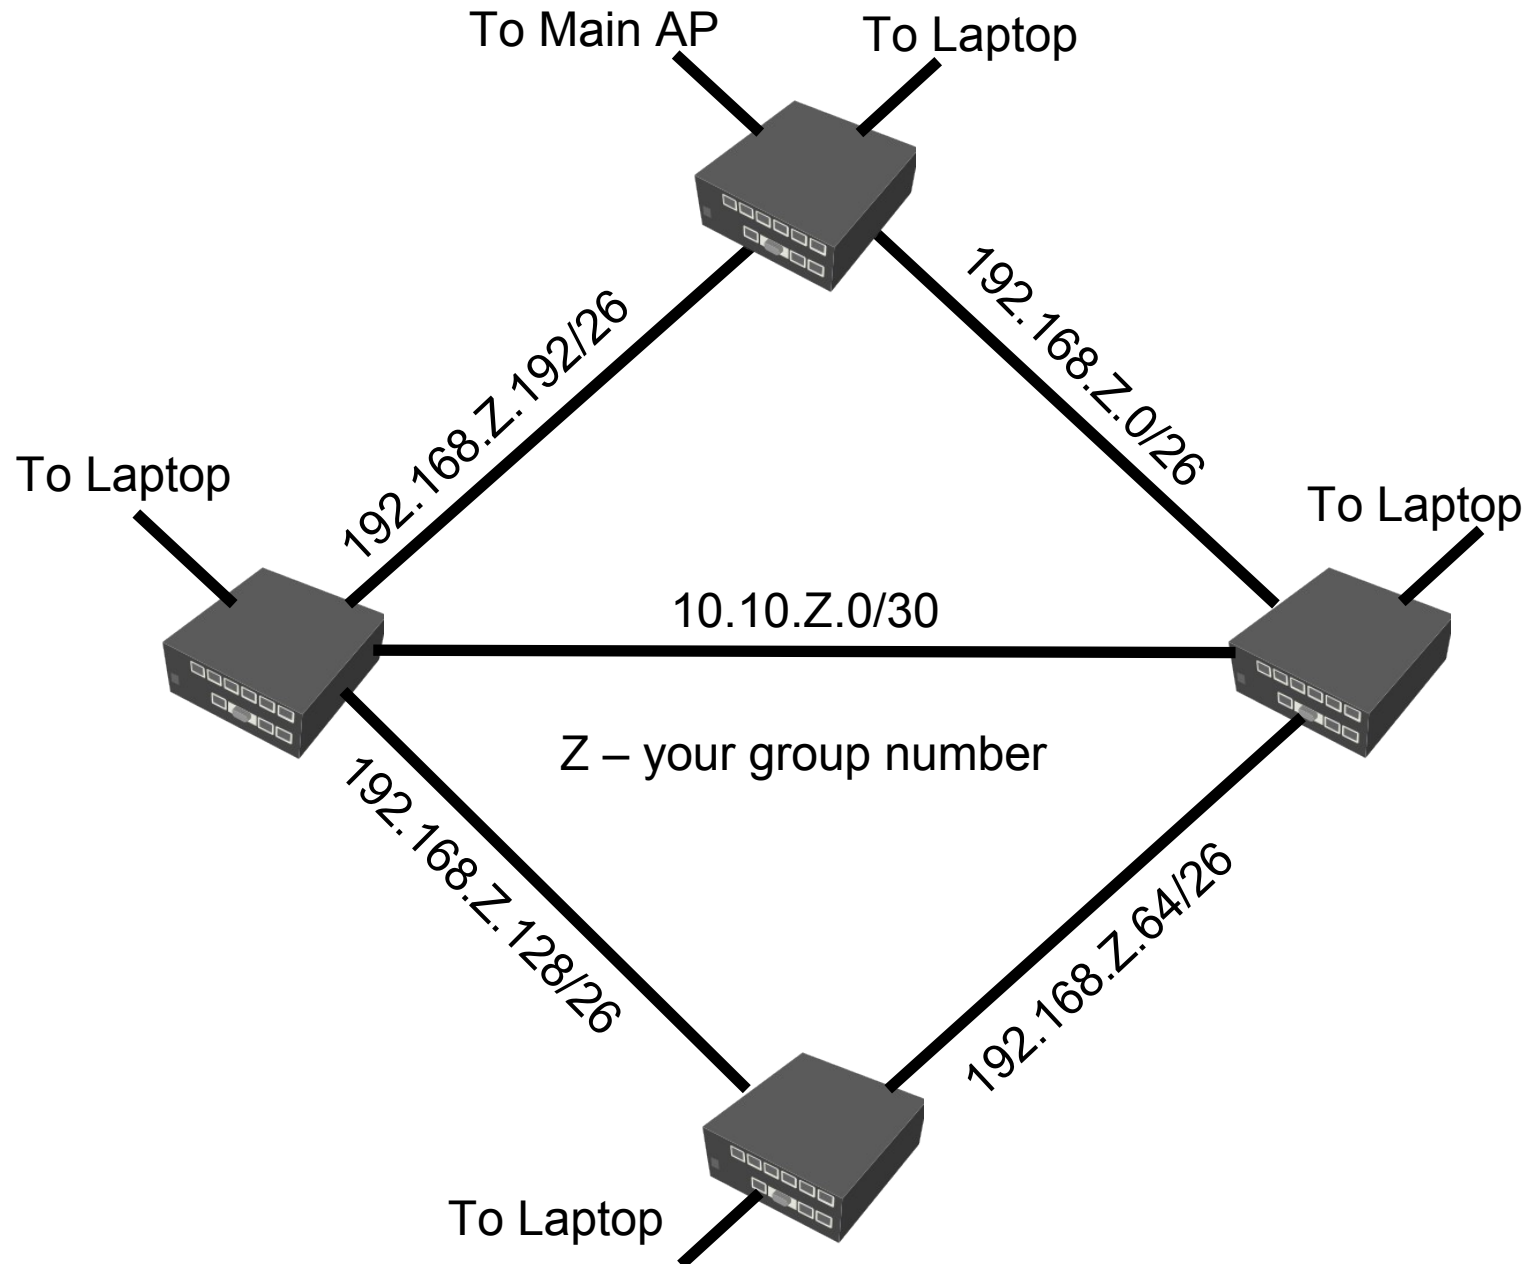

Bottom checkboxes: disabled, active.

- Only one gateway for a single network
- More specific routes in the routing table have higher priority than less specific
- Route with destination network 0.0.0.0/0 basically means “everything else”

Simple Routing Lab

- Ask teacher to join you in a group of 4 and assign specific group number “Z”
- Use any means necessary (cables, wireless) to create IP network structure from the **next slide**
- Remove any NAT (masquerade) rules from your routers
- By using simple static routes only ensure connectivity between laptops

IP Network Structure

Questions!

- Is it possible to manually create routes that will ensure
 - ◆ load balancing
 - ◆ failover
 - ◆ best path
- Is it possible to create routes in this situation?
- Lets take a look!

ECMP Routes

The screenshot shows the 'New Route' dialog box with the following fields and values:

- Destination: 192.168.XY.0/24
- Gateway: 192.168.Z.1, 192.168.Z.127, 10.1.Z.2
- Interface: (empty)
- Check Gateway: (empty)
- Type: unicast
- Distance: (empty)
- Scope: 255
- Target Scope: 10
- Routing Mark: (empty)
- Pref. Source: (empty)

Buttons: OK, Cancel, Apply, Disable, Comment, Copy, Remove

Bottom: disabled, active

- ECMP (Equal Cost Multi Path) routes have more than one gateway to the same remote network
- Gateways will be used in Round Robin per SRC/DST address combination
- Same gateway can be written several times!!

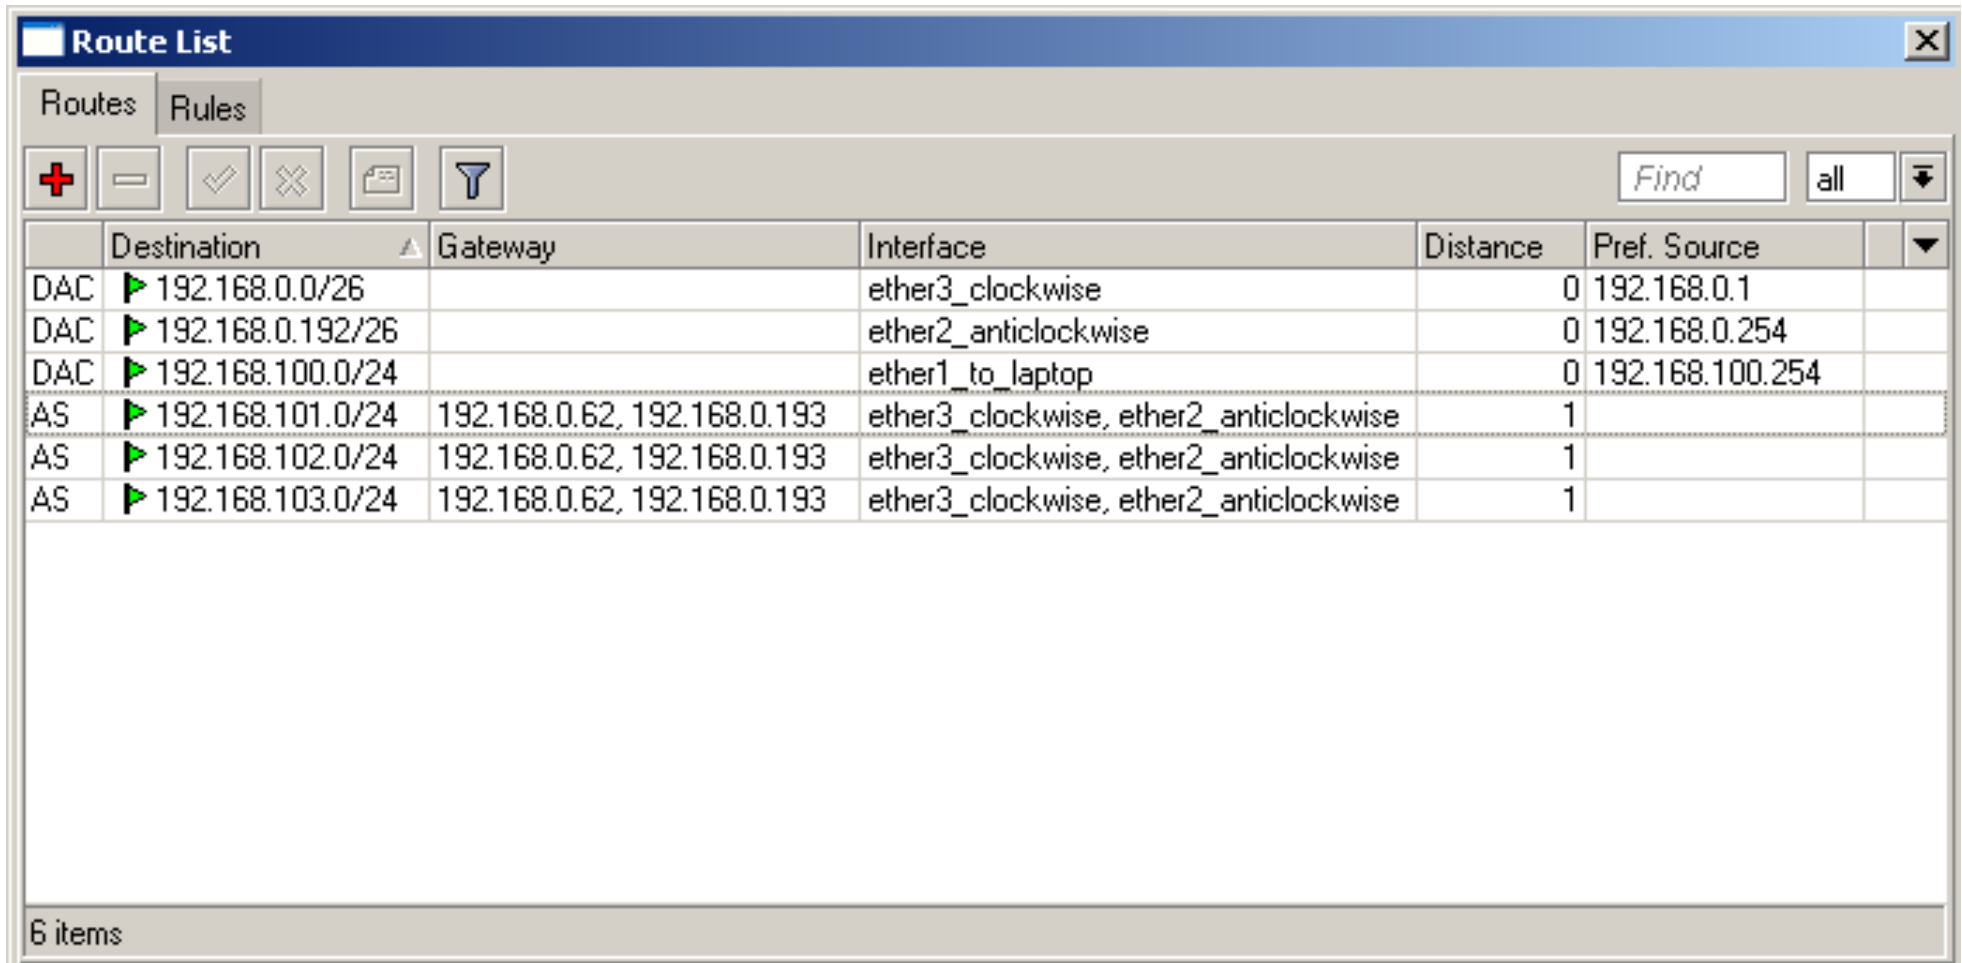

“Check-gateway” Option

- You can set router to check gateway reachability using ICMP (ping) or ARP protocols
- If gateway is unreachable in a simple route – the route will become inactive
- If one gateway is unreachable in an ECMP route, only the reachable gateways will be used in the Round Robin algorithm
- If Check-gateway option is enabled on one route it will affect all routes with that gateway.

ECMP Lab

- To avoid routing loops
 - ◆ Only one participant creates ECMP to every 192.168.XY.0/24 network with “check-gateway”
 - ◆ Other participants adjust simple routes to reach each other without routes through the first participant
- Check the redundancy
- Use traceroute to examine the setup
- Use “Undo” to get back pre-lab configuration - **only then proceed to next participant and start over**

Configuration Example

The screenshot shows the 'Route List' window in Mikrotik WinBox. It features a toolbar with icons for adding (+), removing (-), enabling (checkmark), disabling (X), refreshing (refresh), and filtering (funnel). A search bar contains the text 'Find' and a dropdown menu is set to 'all'. The main area contains a table with the following data:

	Destination	Gateway	Interface	Distance	Pref. Source	
DAC	▶ 192.168.0.0/26		ether3_clockwise	0	192.168.0.1	
DAC	▶ 192.168.0.192/26		ether2_anticlockwise	0	192.168.0.254	
DAC	▶ 192.168.100.0/24		ether1_to_laptop	0	192.168.100.254	
AS	▶ 192.168.101.0/24	192.168.0.62, 192.168.0.193	ether3_clockwise, ether2_anticlockwise	1		
AS	▶ 192.168.102.0/24	192.168.0.62, 192.168.0.193	ether3_clockwise, ether2_anticlockwise	1		
AS	▶ 192.168.103.0/24	192.168.0.62, 192.168.0.193	ether3_clockwise, ether2_anticlockwise	1		

6 items

“Distance” Option

- To prioritize one route over another, if they both point to the same network, using “distance” option.
- When forwarding a packet, the router will use the route with the lowest distance and reachable gateway

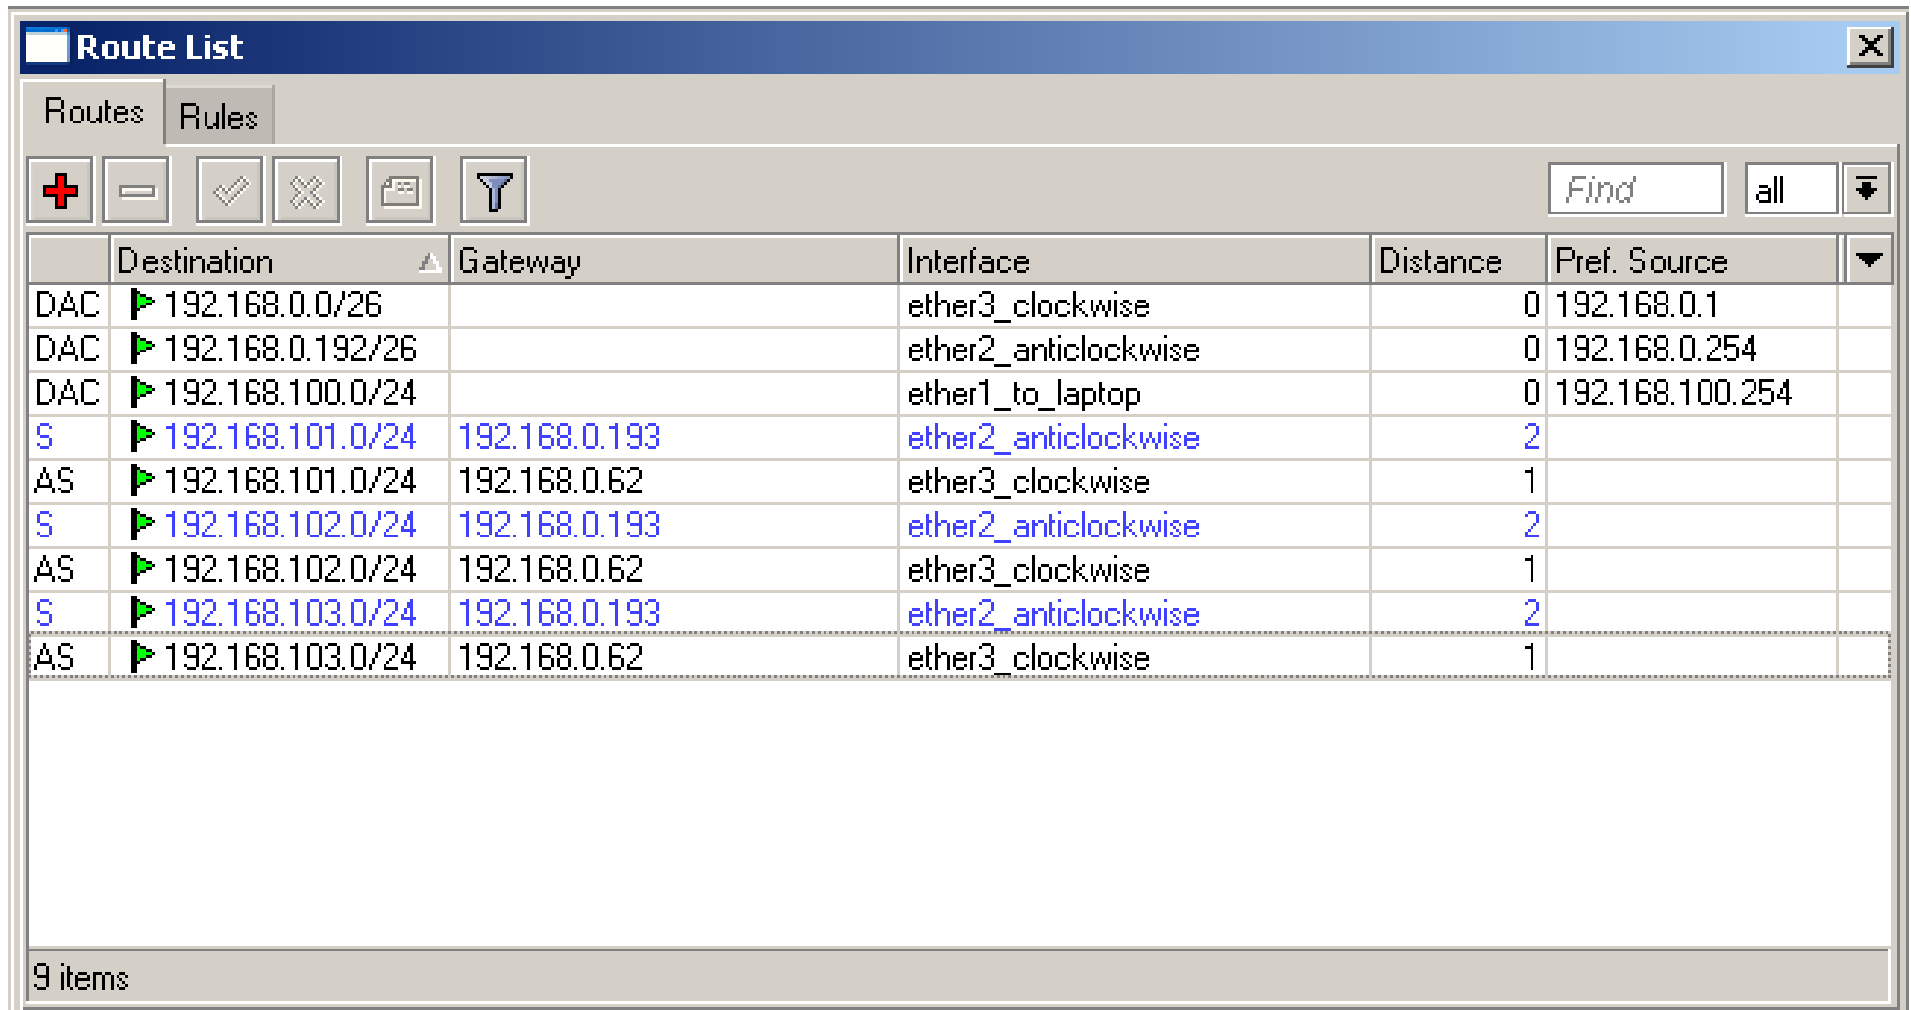

Route Distance Lab

- Create 2 separate routes for each participants local network:
 - ◆ One route clockwise with Distance=1
 - ◆ One route anticlockwise with Distance=2
- Check the redundancy by disabling clockwise gateway IP addresses
- Use traceroute to examine the setup

Route Distance Lab

Configuration Example

The screenshot shows the 'Route List' window in Mikrotik WinBox. It features a toolbar with icons for adding, deleting, and filtering routes, along with a search field. The main area contains a table with columns for Destination, Gateway, Interface, Distance, and Pref. Source. The table lists 9 items, including routes for DAC and S (Static) destinations.

	Destination	Gateway	Interface	Distance	Pref. Source
DAC	▶ 192.168.0.0/26		ether3_clockwise	0	192.168.0.1
DAC	▶ 192.168.0.192/26		ether2_anticlockwise	0	192.168.0.254
DAC	▶ 192.168.100.0/24		ether1_to_laptop	0	192.168.100.254
S	▶ 192.168.101.0/24	192.168.0.193	ether2_anticlockwise	2	
AS	▶ 192.168.101.0/24	192.168.0.62	ether3_clockwise	1	
S	▶ 192.168.102.0/24	192.168.0.193	ether2_anticlockwise	2	
AS	▶ 192.168.102.0/24	192.168.0.62	ether3_clockwise	1	
S	▶ 192.168.103.0/24	192.168.0.193	ether2_anticlockwise	2	
AS	▶ 192.168.103.0/24	192.168.0.62	ether3_clockwise	1	

9 items

Observed Behaviour

- Traffic has no problems to pass clockwise
- In the case of “check-gateway” failure only affected router will pass traffic anticlockwise – every other router will continue to send it clockwise
- Solution:
 - If traffic starts to go anticlockwise, it should be routed anticlockwise until it reaches destination

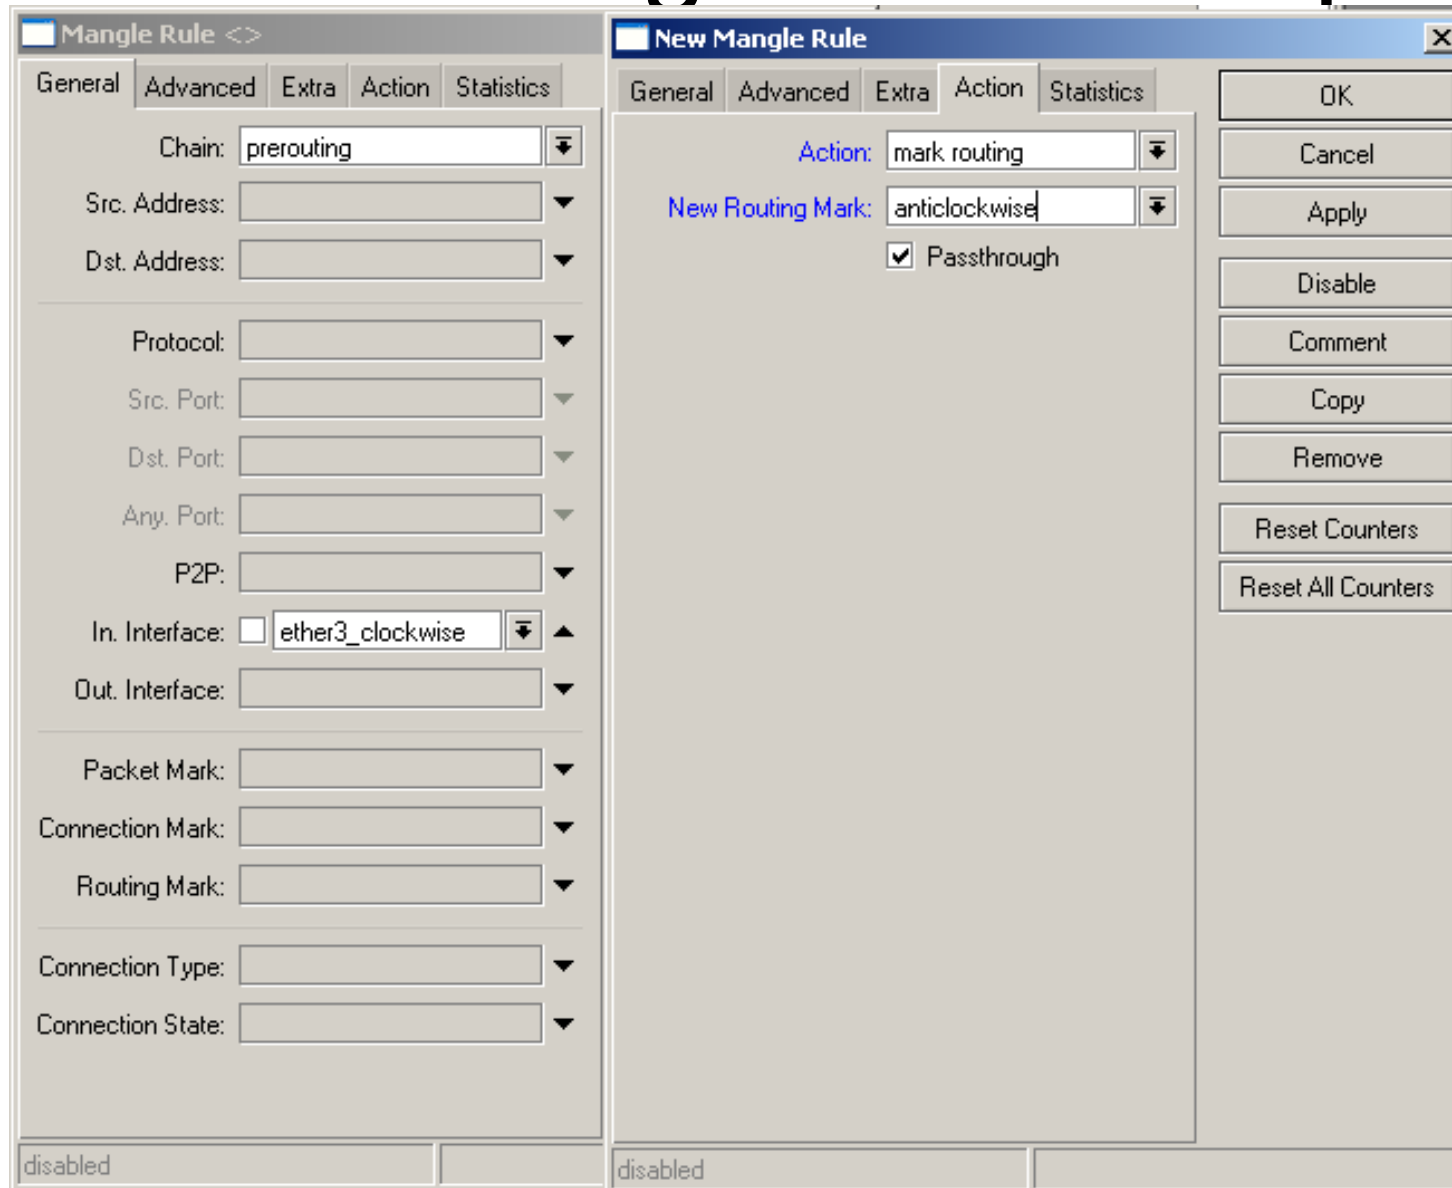

Routing Mark

- To assign specific traffic to the route – traffic must be identified by routing mark
- Routing marks can be assigned by IP firewall mangle facility **only in** chains prerouting and output
- Packets with the routing mark will be ignored by main routing table, if there is at least one route for that routing mark (if none main routing table will be used)
- Each packet can have only one routing mark

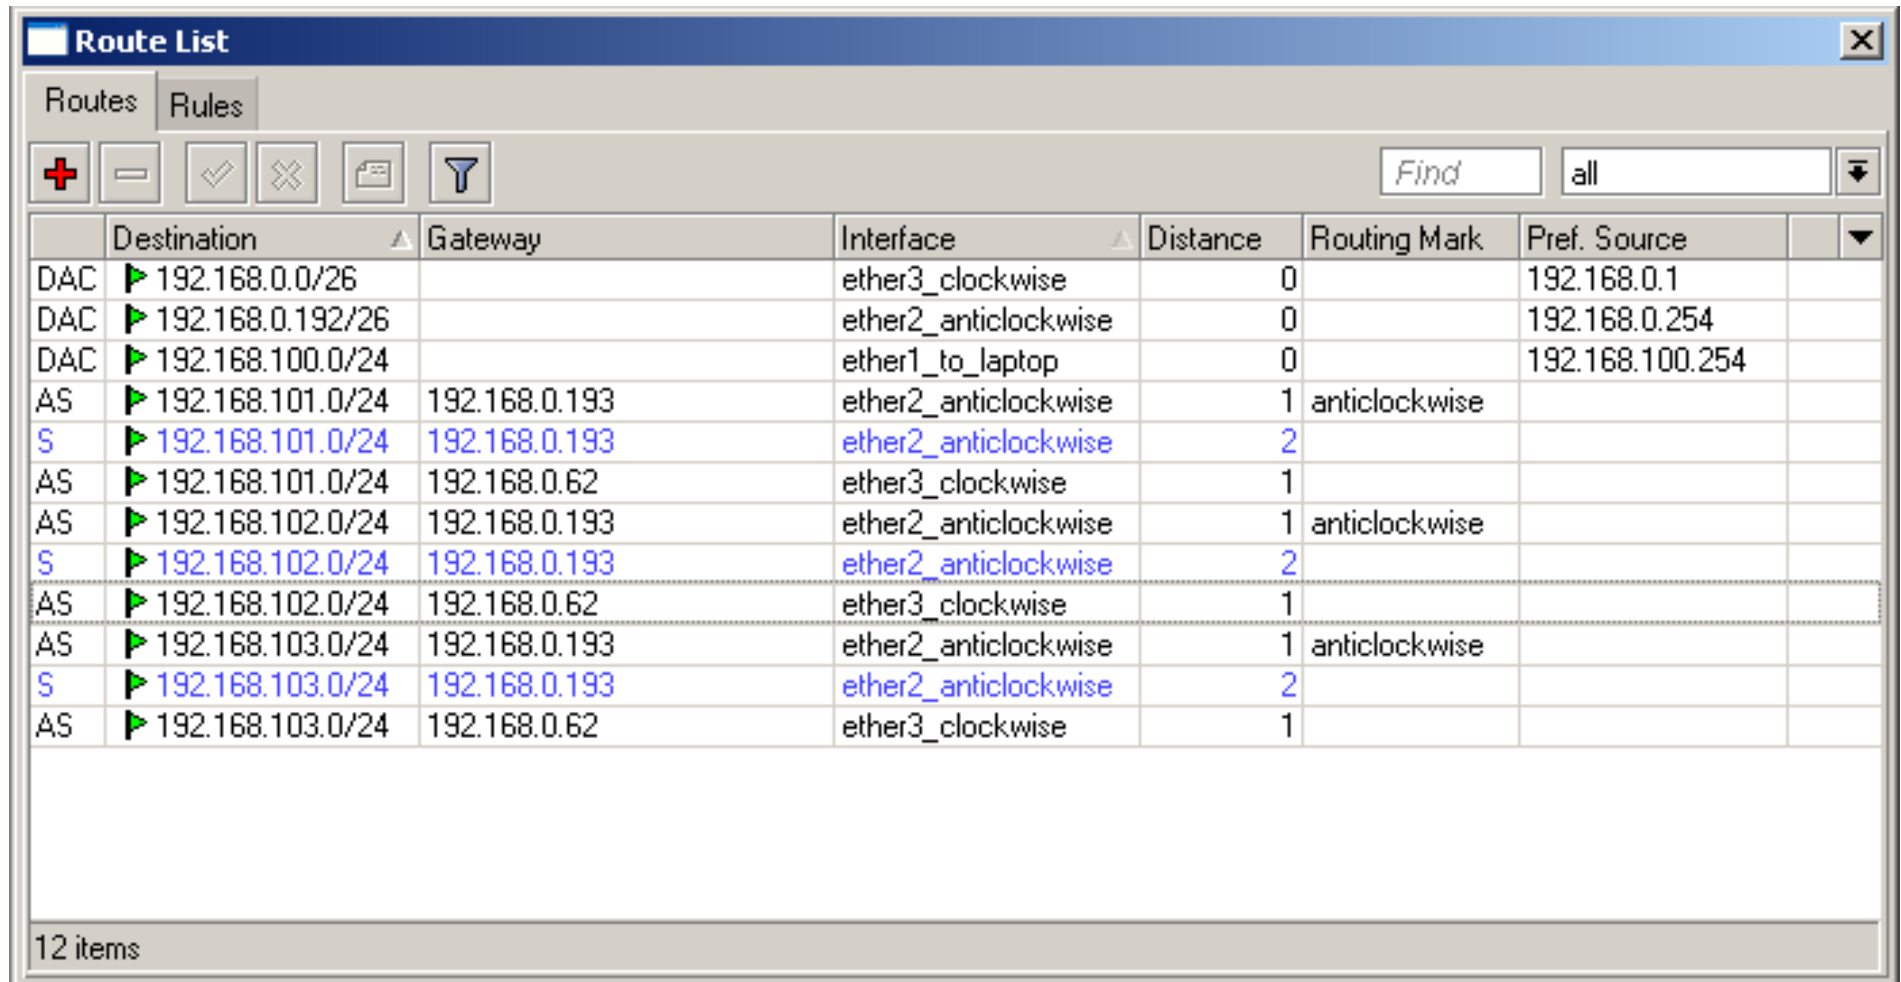

Routing Policy Lab

- Mark all traffic that passes the router (chain prerouting) in anticlockwise direction
- Create a route for marked traffic (use routing-mark option) and send it in anticlockwise direction
- Check the redundancy by disabling clockwise gateway IP addresses
- Use traceroute to examine the setup

Mark Routing Rule Example

Configuration Example

The screenshot shows the 'Route List' window in Mikrotik WinBox. It features a toolbar with icons for adding, deleting, and filtering routes, along with a search field containing 'Find' and 'all'. The main area is a table with columns for Destination, Gateway, Interface, Distance, Routing Mark, and Pref. Source. The table contains 12 entries, including DAC and AS routes with various gateways and interfaces.

	Destination ▲	Gateway	Interface ▲	Distance	Routing Mark	Pref. Source	
DAC	▶ 192.168.0.0/26		ether3_clockwise	0		192.168.0.1	
DAC	▶ 192.168.0.192/26		ether2_anticlockwise	0		192.168.0.254	
DAC	▶ 192.168.100.0/24		ether1_to_laptop	0		192.168.100.254	
AS	▶ 192.168.101.0/24	192.168.0.193	ether2_anticlockwise	1	anticlockwise		
S	▶ 192.168.101.0/24	192.168.0.193	ether2_anticlockwise	2			
AS	▶ 192.168.101.0/24	192.168.0.62	ether3_clockwise	1			
AS	▶ 192.168.102.0/24	192.168.0.193	ether2_anticlockwise	1	anticlockwise		
S	▶ 192.168.102.0/24	192.168.0.193	ether2_anticlockwise	2			
AS	▶ 192.168.102.0/24	192.168.0.62	ether3_clockwise	1			
AS	▶ 192.168.103.0/24	192.168.0.193	ether2_anticlockwise	1	anticlockwise		
S	▶ 192.168.103.0/24	192.168.0.193	ether2_anticlockwise	2			
AS	▶ 192.168.103.0/24	192.168.0.62	ether3_clockwise	1			

12 items

Time To Live (TTL)

- TTL is a limit of Layer3 devices that IP packet can experience before it should be discarded
- TTL default value is 64 and each router reduce value by one **just before** forwarding decision
- TTL can be adjusted in **IP firewall manage** facility
- Router will not pass traffic to the next device if it receives IP packet with TTL=1
- Useful application: eliminate possibility for clients to create masqueraded networks

Changing TTL

The image shows two windows from the Mikrotik WinBox interface. The left window is titled "Mangle Rule <1.1.1.1>" and has tabs for "General", "Advanced", "Extra", "Action", and "Statistics". The "General" tab is active, showing fields for Chain (prerouting), Src. Address, Dst. Address, Protocol, Src. Port, Dst. Port, Any. Port, P2P, In. Interface (ether1_to_laptop), Out. Interface, Packet Mark, Connection Mark, Routing Mark, Connection Type, and Connection State. The right window is titled "New Mangle Rule" and also has tabs for "General", "Advanced", "Extra", "Action", and "Statistics". The "Action" tab is active, showing the Action set to "change TTL", the TTL Action set to "change" (selected with a radio button), and the New TTL set to "6". A vertical stack of buttons is on the right side of the "New Mangle Rule" window, including OK, Cancel, Apply, Disable, Comment, Copy, Remove, Reset Counters, and Reset All Counters. Both windows have a "disabled" status indicator at the bottom.

Recursive Next-hop Resolving

- It is possible to specify gateway to network even if gateway is not directly reachable – by using recursive next-hop resolving from any existing route
- Useful for setups where middle section between your router and the gateway is not constant (iBGP for example)
- One route must be in **scope** of other route for recursive next-hop resolving to work

Scope/Target-Scope

- Route's scope contains all routes that “scope” value is less or equal to its “target-scope” value

Example:

0 ADC dst-address=1.1.1.0/24 pref-src=1.1.1.1
interface=ether1 scope=10 target-scope=0

1 A S dst-address=2.2.2.0/24 gateway=1.1.1.254
interface=ether1 scope=30 target-scope=10

2 A S dst-address=3.3.3.0/24 gateway=2.2.2.254
interface=ether1 scope=30 **target-scope=30**

Scope Route type Target Scope

Other Options

- **“Type” option** allows to create dead-end (blackhole/prohibit/unreachable) routes to block some networks to be routed further in the network
- **“Preferred Source” option** points preferred router source address for locally originated packets

Clean-up Lab

- Delete all mangle rules
- Delete all IP routes
- Leave all IP addresses and network structure intact

Open Shortest Path First (OSPF)

Areas, Costs, Virtual links,
Route Redistribution and Aggregation

OSPF Protocol

- Open Shortest Path First protocol uses a link-state and Dijkstra algorithm to build and calculate the shortest path to all known destination networks
- OSPF routers use IP protocol 89 for communication with each other
- OSPF distributes routing information between the routers belonging to a single autonomous system (AS)

Autonomous System (AS)

- An autonomous system is a collection of IP networks and routers under the control of one entity (OSPF, iBGP ,RIP) that presents a common routing policy to rest of the network
- AS is identified by 16 bit number (0 - 65535)
 - ◆ Range from 1 to 64511 for use in the Internet
 - ◆ Range from 64512 to 65535 for private use

OSPF Areas

- OSPF allows collections of routers to be grouped together (<80 routers in one group)
- The structure of an area is invisible from the outside of the area.
- Each area runs a separate copy of the basic link-state routing algorithm
- OSPF areas are identified by 32-bit (4-byte) number (0.0.0.0 – 255.255.255.255)
- Area ID must be unique within the AS

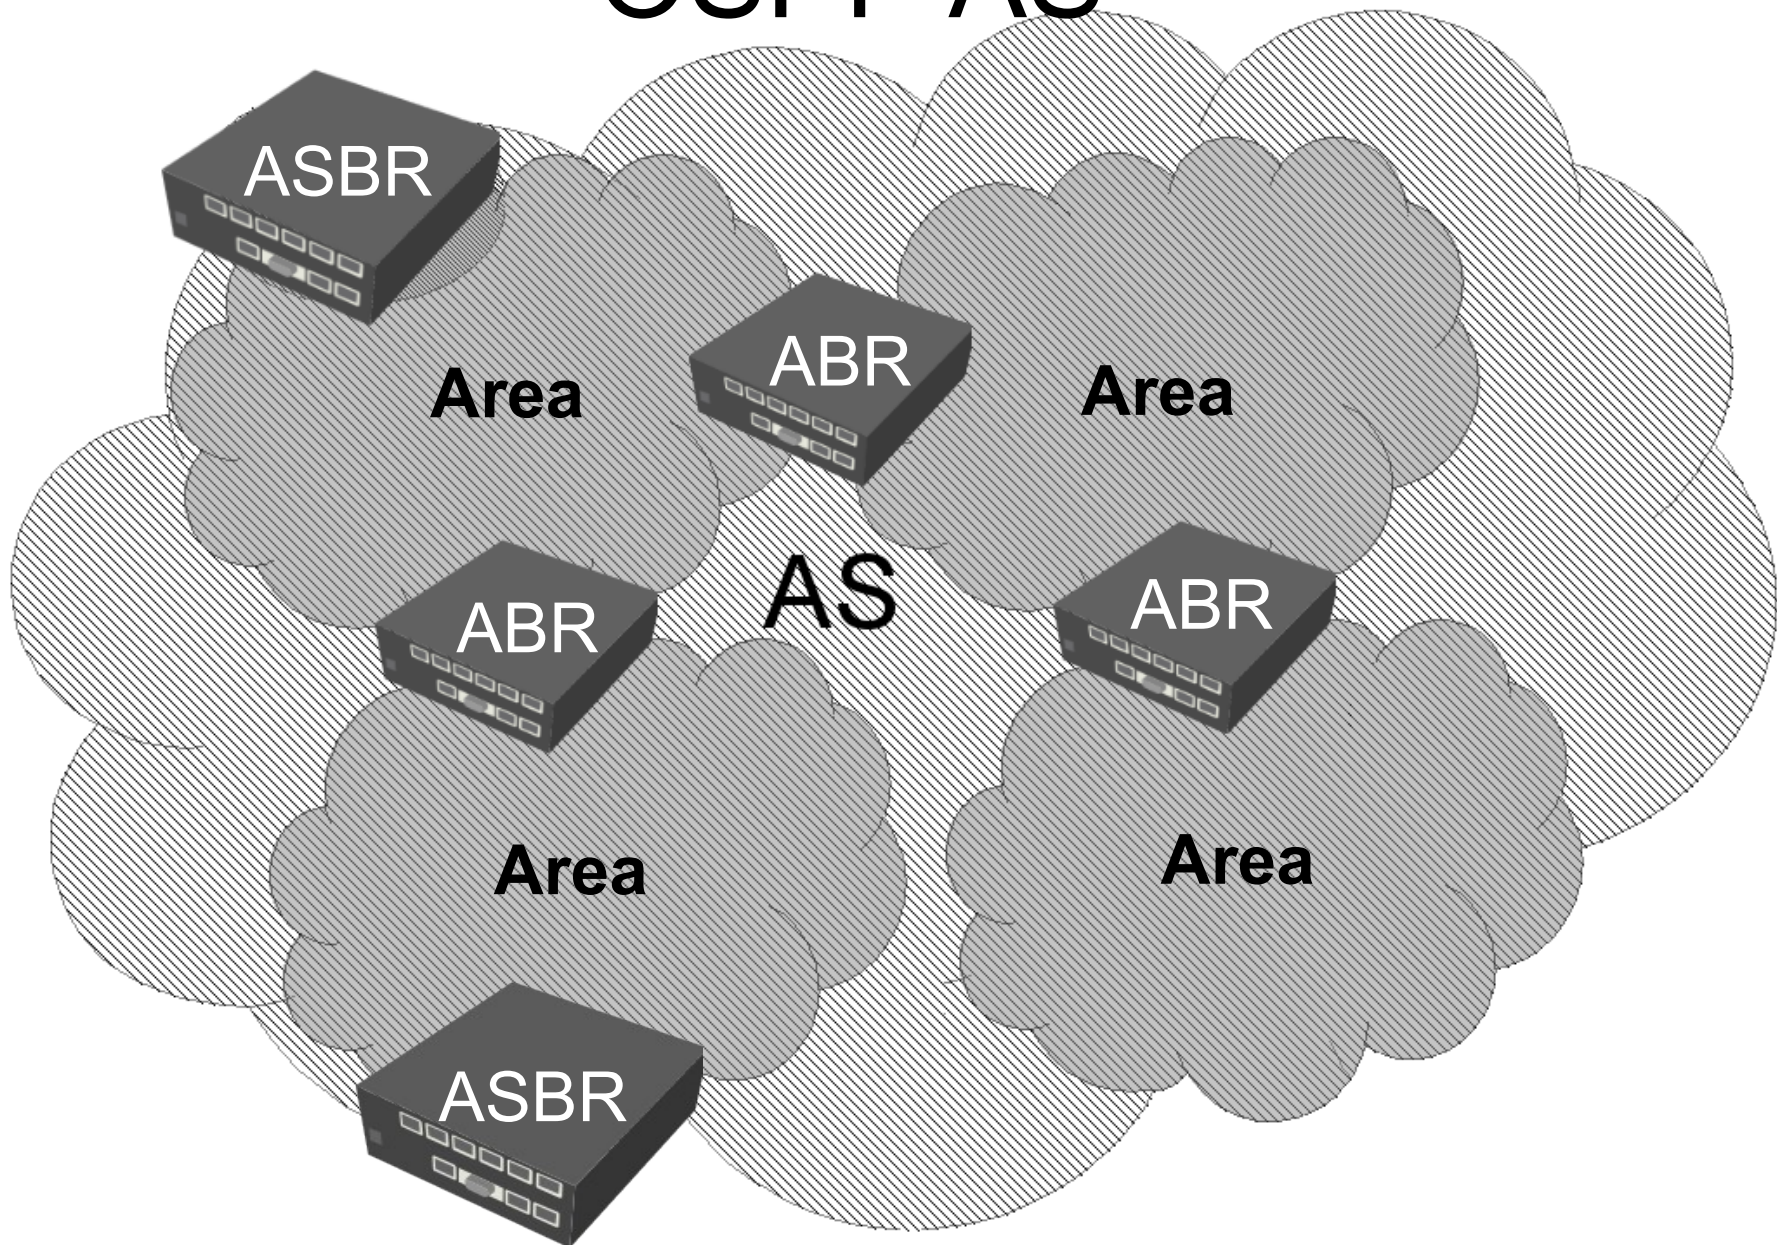

OSPF AS

Router Types

- Autonomous System Border Router (ASBR) - a router that is connected to more than one AS.
 - ◆ An ASBR is used to distribute routes received from other ASes throughout its own AS
- Area Border Router (ABR) - a router that is connected to more than one OSPF area.
 - ◆ An ABR keeps multiple copies of the link-state database in memory, one for each area
- Internal Router (IR) – a router that is connected only to one area

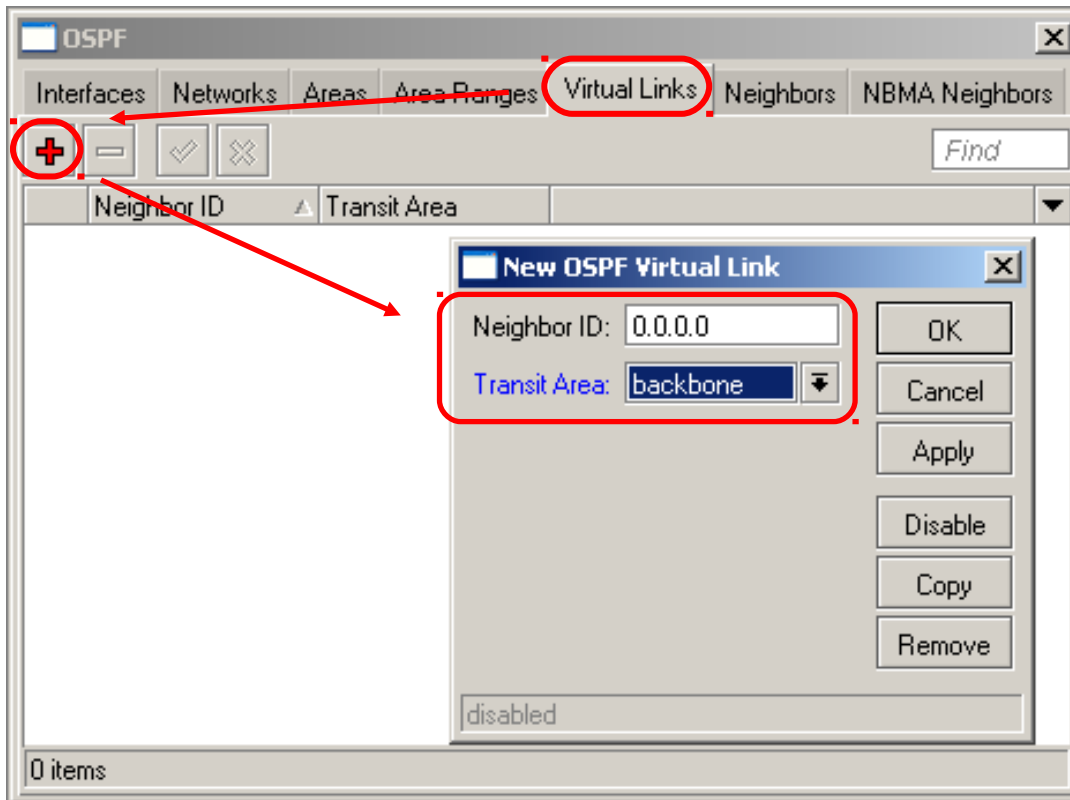

OSPF AS

Backbone Area

- The backbone area (area-id=0.0.0.0) forms the core of an OSPF network
- The backbone is responsible for distributing routing information between non-backbone areas
- Each non-backbone area must be connected to the backbone area (directly or using virtual links)

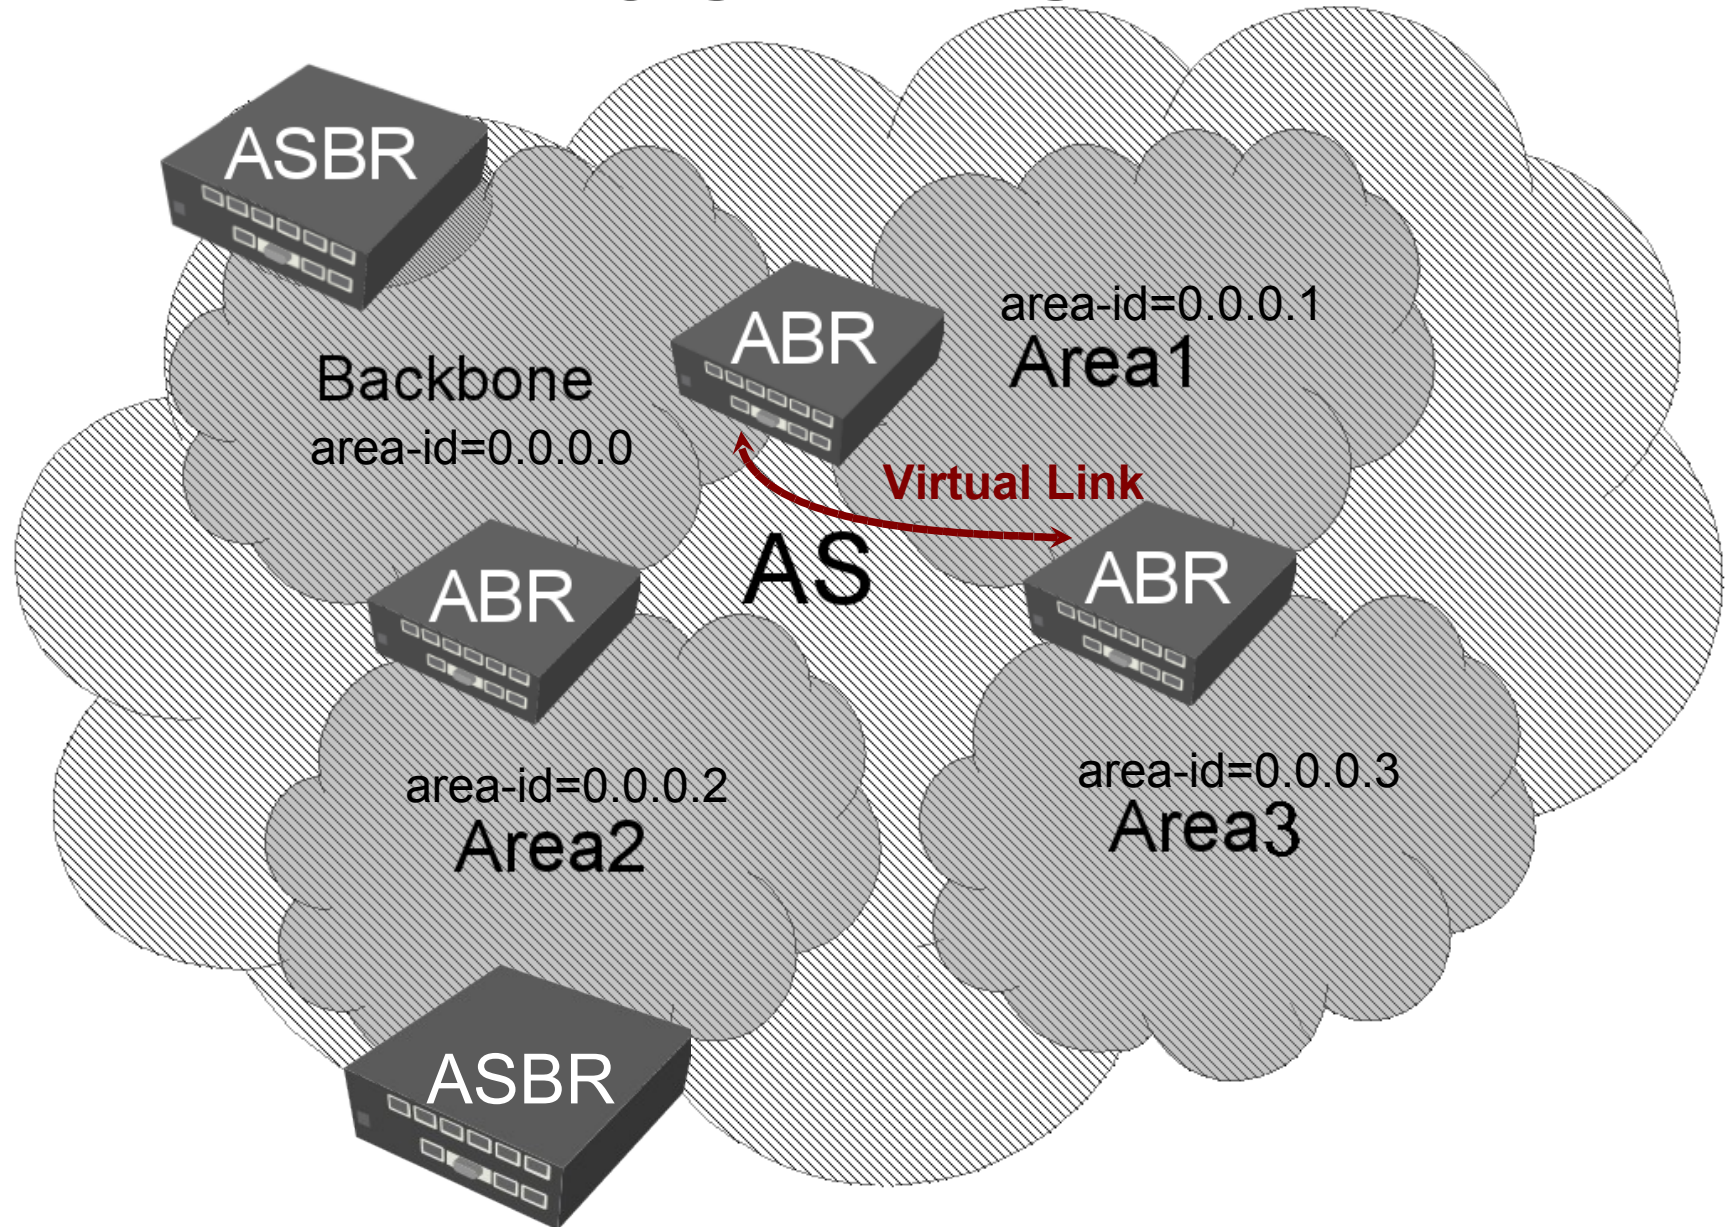

Virtual Links

- Used to connect remote areas to the backbone area through a non-backbone area

- Also Used to connect two parts of a partitioned backbone area through a non-backbone area

OSPF AS

OSPF Areas

The screenshot displays the Mikrotik RouterOS WinBox interface. On the left, the 'Routing' menu is expanded, with 'OSPF' selected. The main window shows the OSPF configuration page, with the 'Areas' tab active. A table lists the current OSPF areas:

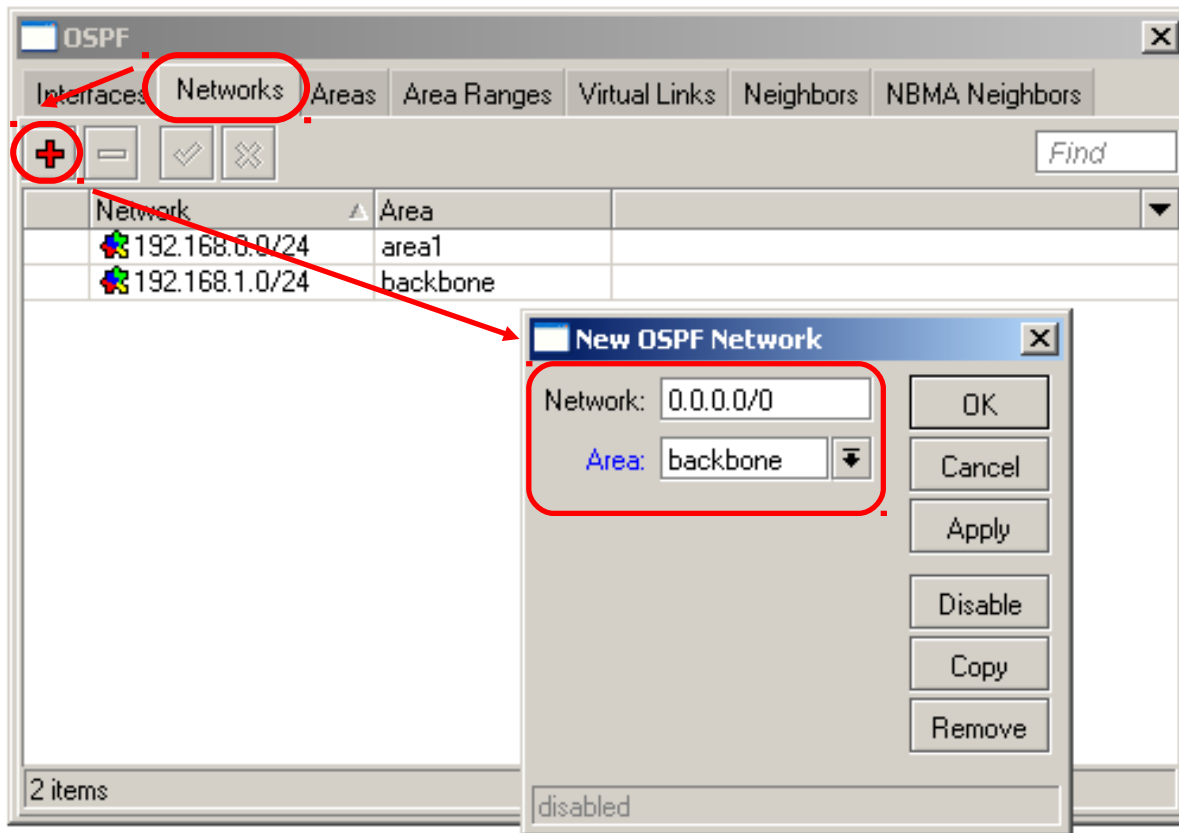

Area Name	Area ID	Type	Authentic...	Default C...	Interfac...	Active I...	Neighb...
backbone	0.0.0.0	default	none		0	0	0

A 'New OSPF Area' dialog box is open, showing the following configuration:

- Area Name: area1
- Area ID: 0.0.0.1
- Type: default
- Translator Role: translate never
- Authentication: none
- Inject Summary LSA
- Default Cost: 1
- Interfaces: 0
- Active Interfaces: 0
- Neighbors: 0
- Adjacent Neighbors: 0

Red circles and arrows highlight the 'Routing' menu, the 'OSPF' option, the 'New OSPF Area' dialog, and the 'Area Name' and 'Area ID' fields in the dialog.

OSPF Networks

- It is necessary to specify networks and associated areas where to look for other OSPF routers

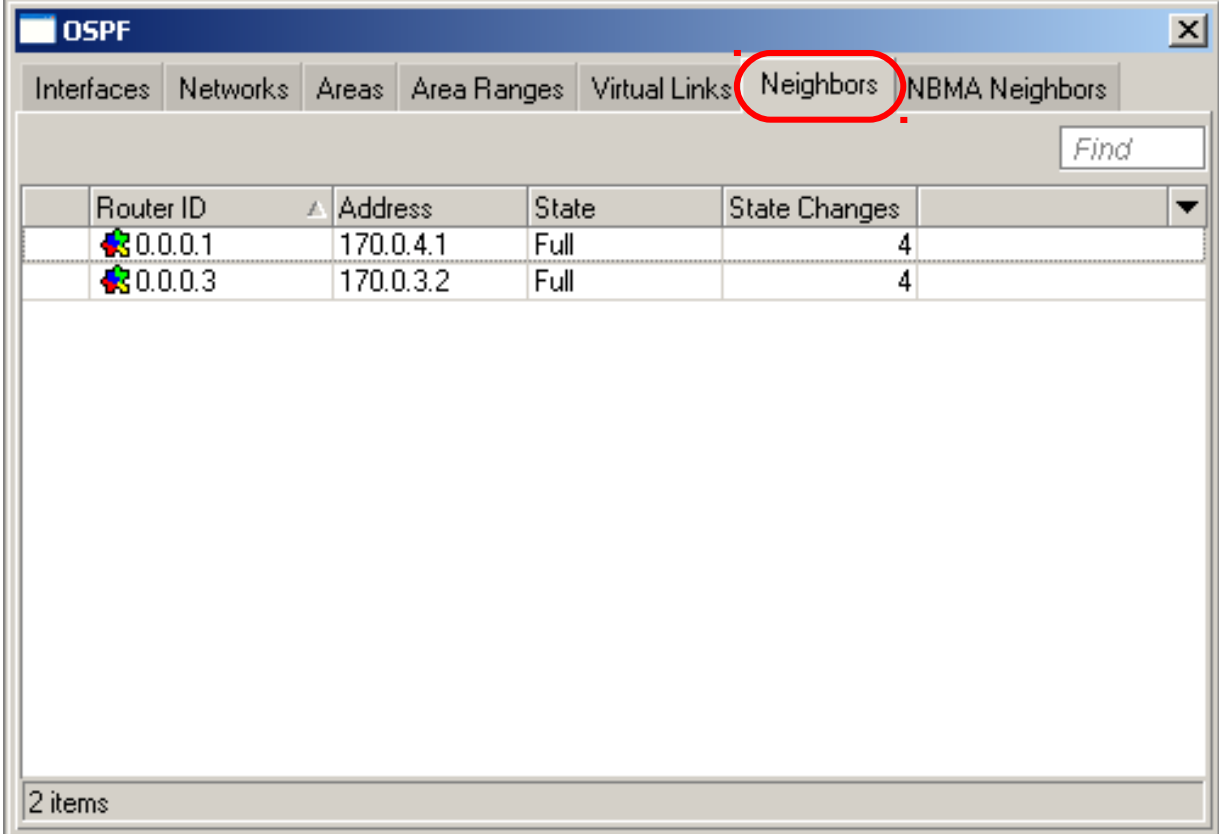

- You should use exact networks from router interfaces (do not aggregate them)

OSPF Neighbour States

- **Full:** link state databases completely synchronized

- **2-Way:** bidirectional communication established

- Down, Attempt, Init, Loading, ExStart, Exchange: not completely running!

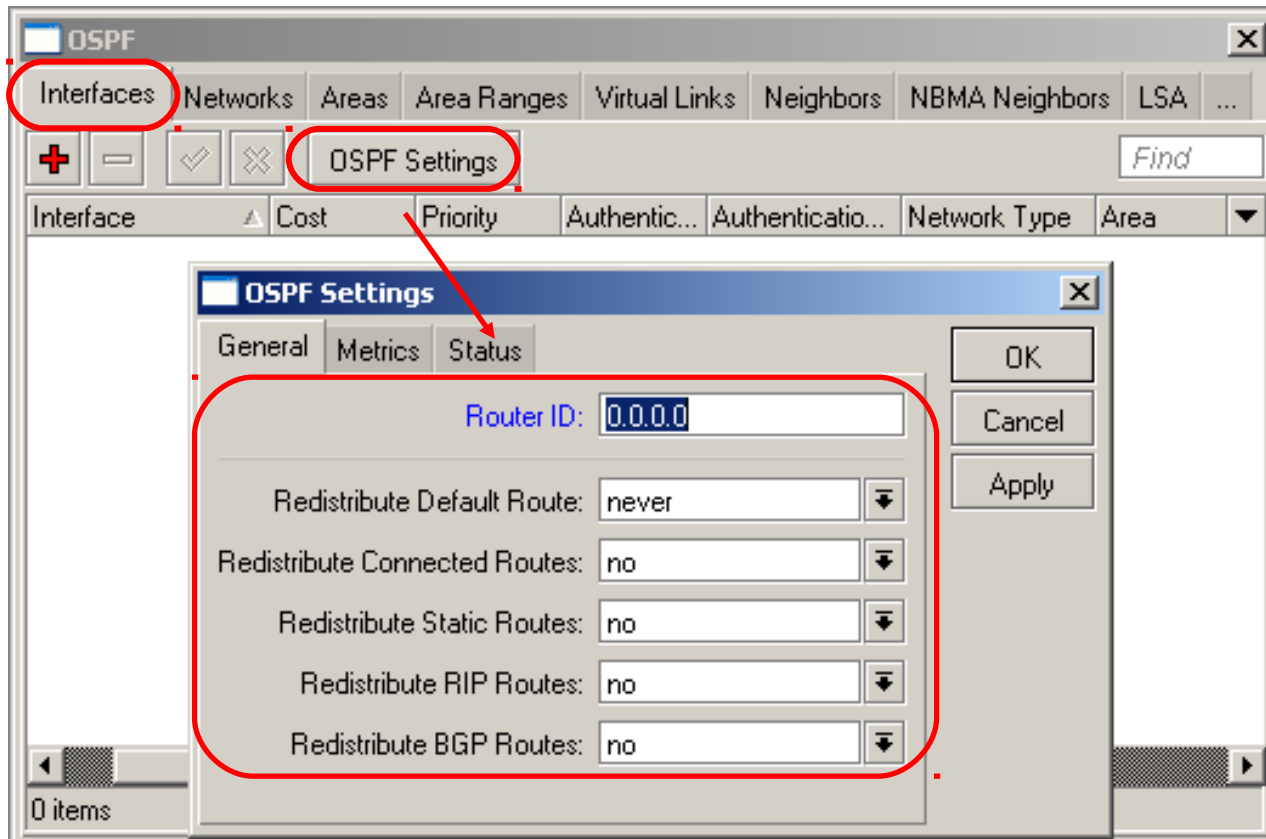

Router ID	Address	State	State Changes
0.0.0.1	170.0.4.1	Full	4
0.0.0.3	170.0.3.2	Full	4

OSPF Area Lab

- Create your own area
 - ◆ area name «Area<Z>»
 - ◆ area-id=0.0.0.<Z>
- Assign networks to the areas
- Check your OSPF neighbors and routing tables
- Owner of the ABR should also configure backbone area and networks
- Main AP should be in ABR's OSPF neighbor list

OSPF Settings

Router ID must be unique within the AS

- Router ID can be left as 0.0.0.0 then largest IP address assigned to the router will be used

What to Redistribute?

- Default route is not considered as static route

The screenshot shows the 'Route List' window in Mikrotik WinBox. The table contains the following data:

	Destination	Gateway	Distance	Routing Mark	Pref. Source	Interface
1	AS 0.0.0.0/0	10.5.8.1	1			ether3
	AS 5.0.0.0/24	10.1.101.219	1			bridge1
	DAB 6.6.6.0/30	10.1.101.239	20			bridge1
	DAC 10.1.101.0/24		0		10.1.101.1	bridge1
	DB 10.1.101.0/24	10.1.101.239	20			bridge1
	DAC 10.5.8.0/24		0		10.5.8.120	ether3
3	AS 10.0.0.133	10.5.8.1	0		10.9.9.9	ipip1
	DAB 10.1.3.0/24	10.1.101.239	20			bridge1
	DAB 10.1.24.0/24	10.1.101.239	20			bridge1
	DAB 10.15.1.0/24	10.1.101.239	200			bridge1
	DAR 172.16.1.0/30	10.1.101.245	120			bridge1
4	DAR 172.16.1.4/30	10.1.101.245	120			bridge1
	DAR 172.16.1.8/30	10.1.101.245	120			bridge1
	DAR 172.16.2.0/30	10.1.101.245	120			bridge1

Red annotations in the image include:

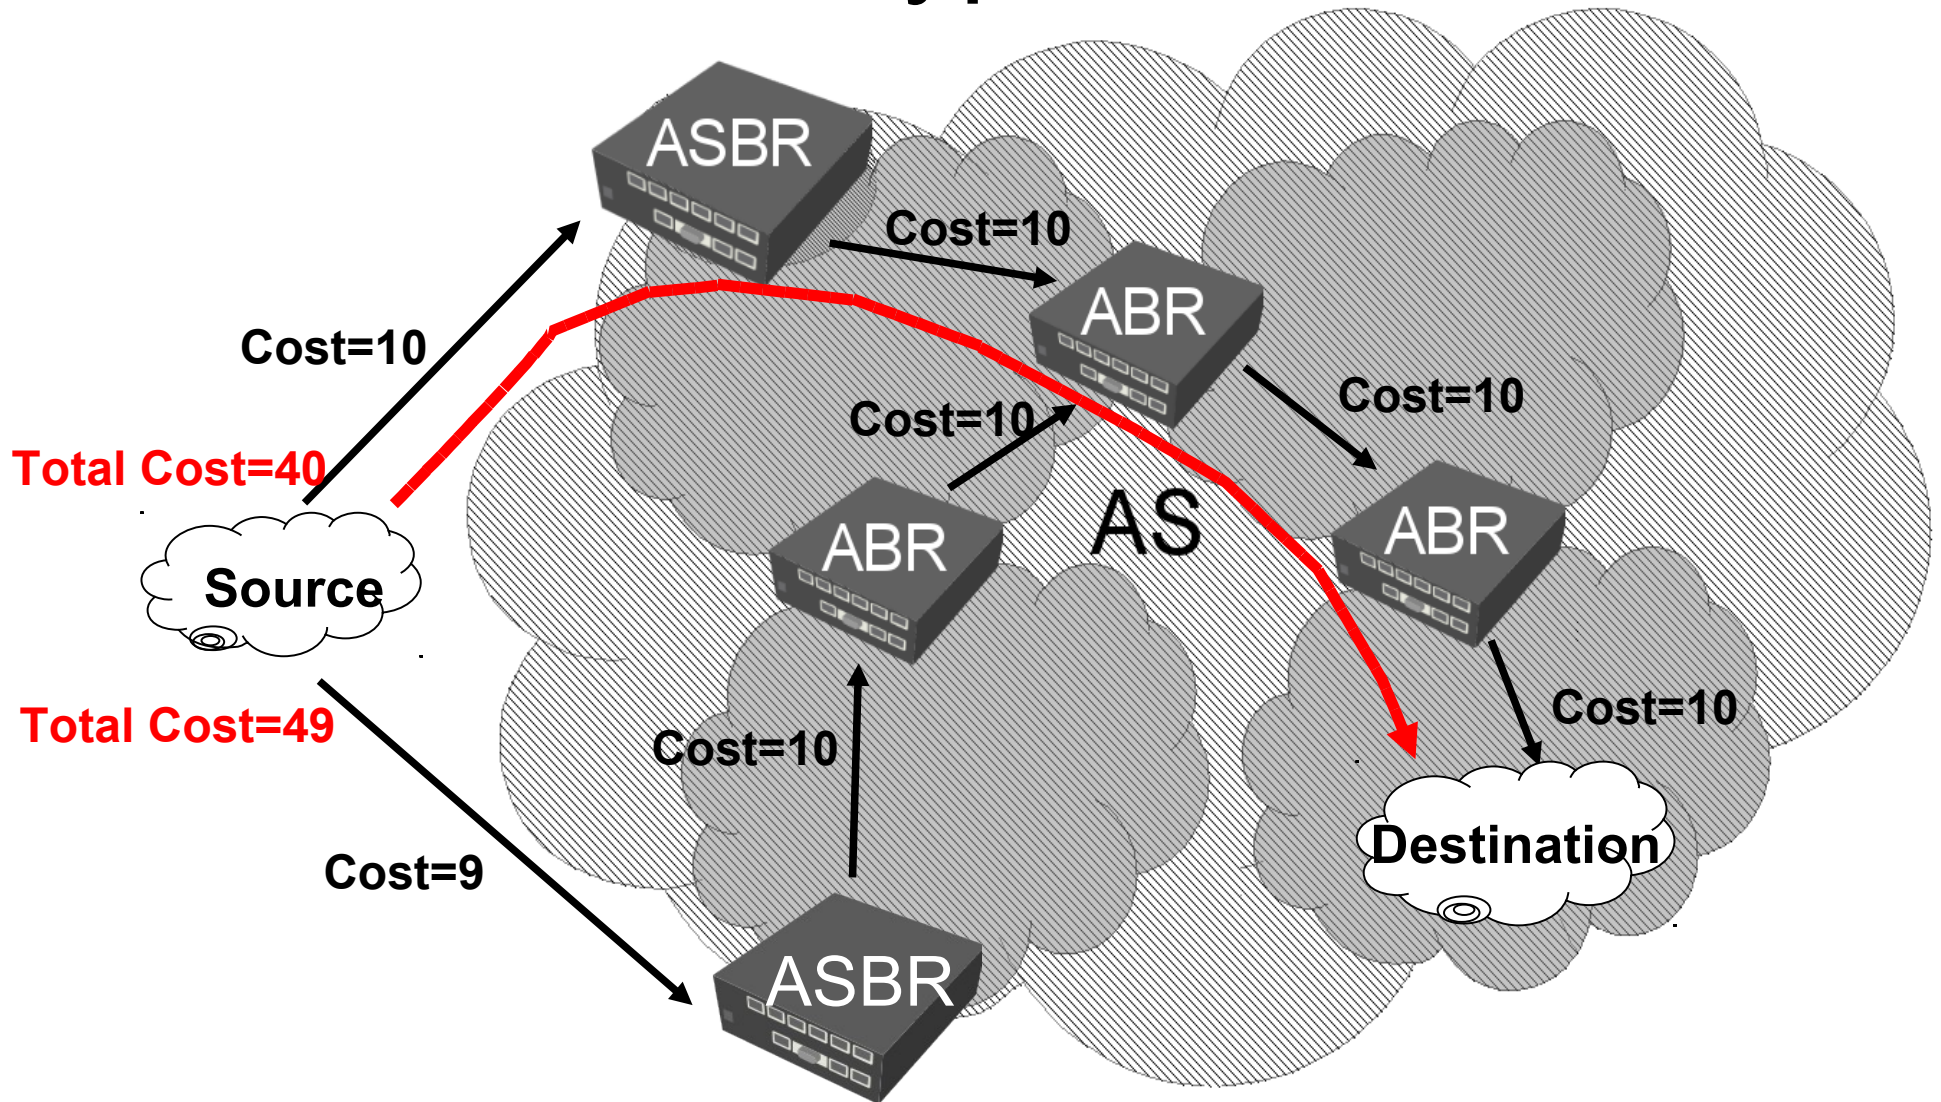

- Number 1 pointing to the first row (AS 0.0.0.0/0).
- Number 2 pointing to the Gateway '10.1.101.239' in the DB row.
- Number 3 pointing to the AS 10.0.0.133 row.
- Number 4 pointing to a group of four DAR rows.
- Number 5 pointing to the Gateway '10.1.101.239' in the DAB 10.1.24.0/24 row.

38 items

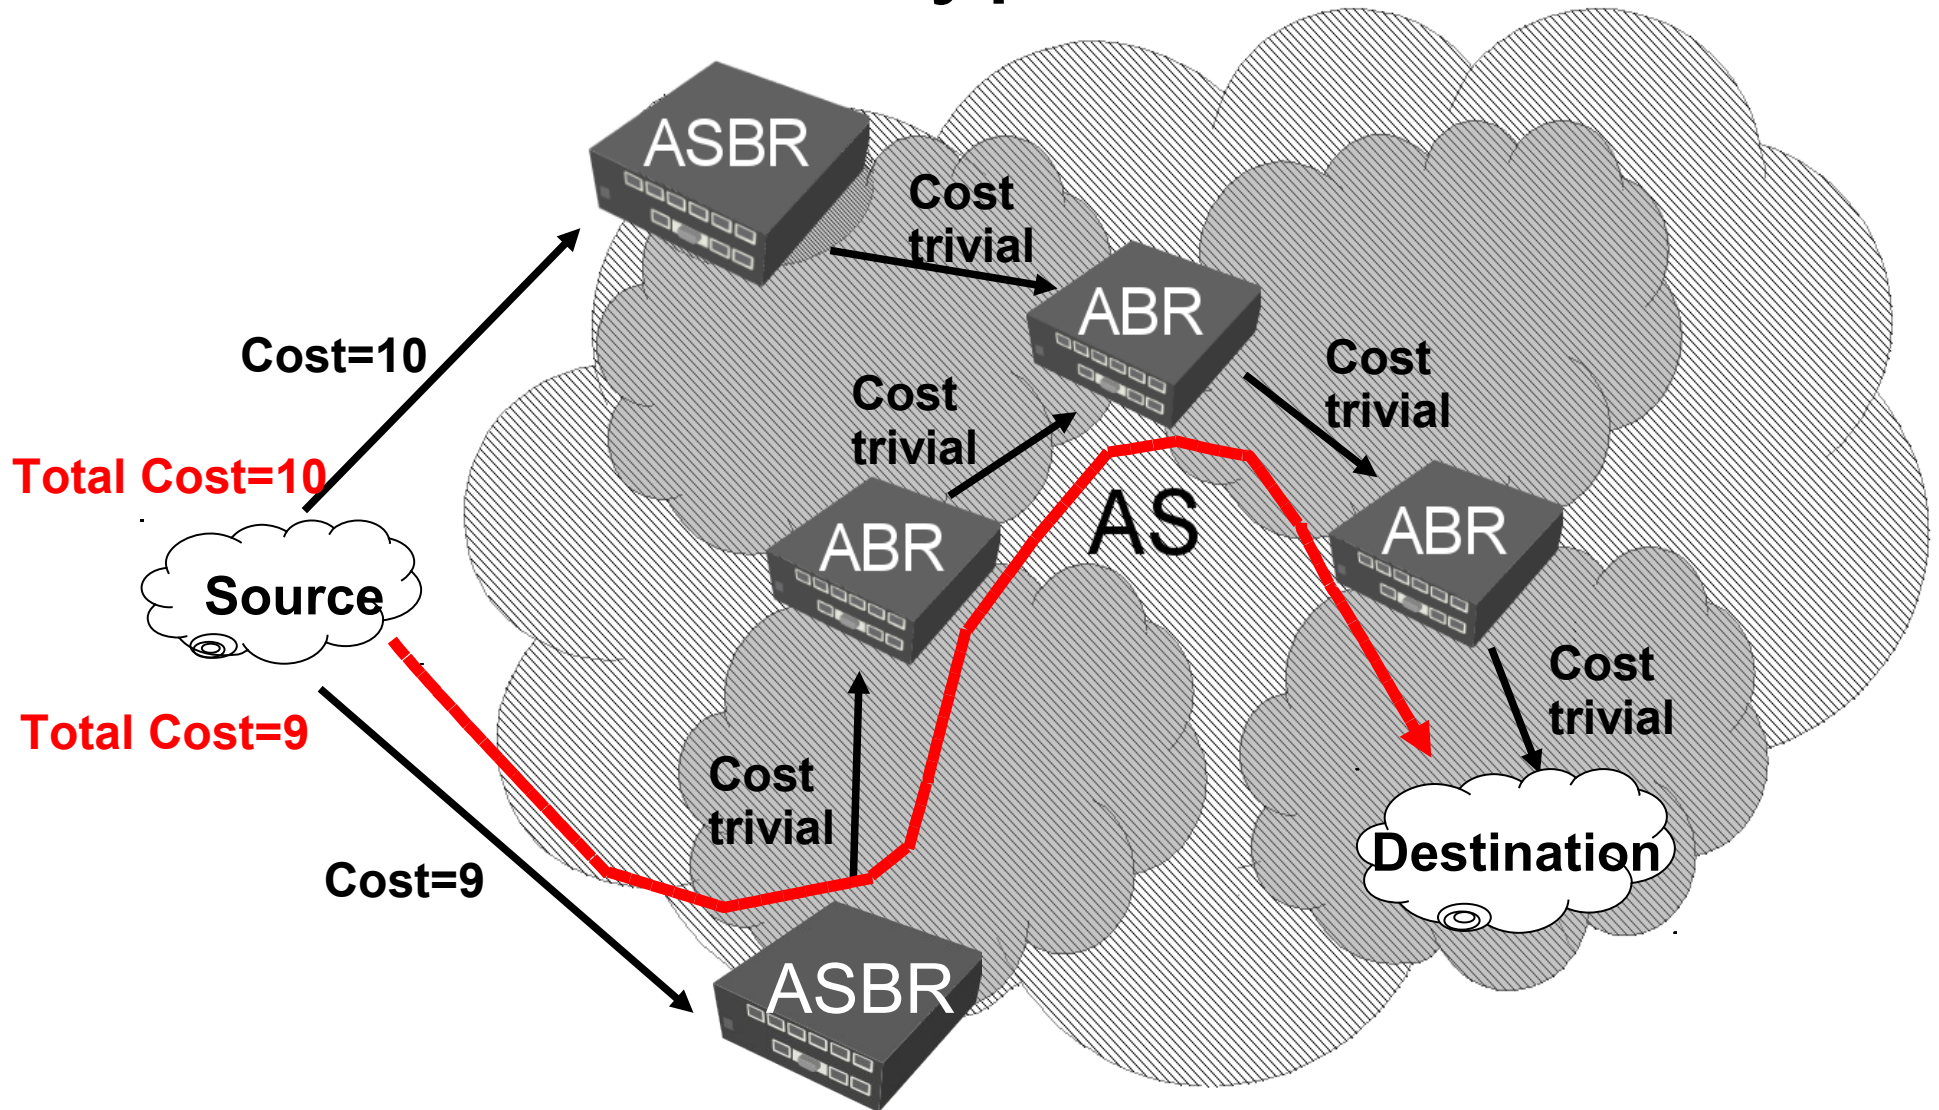

Redistribution Settings

- **if-installed** - send the default route only if it has been installed (static, DHCP, PPP, etc.)
- **always** - always send the default route
- **as-type-1** – remote routing decision to this network will be made based on the sum of the external and internal metrics
- **as-type-2** – remote routing decision to this network will be made based only on external metrics (internal metrics will become trivial)

External Type 1 Metrics

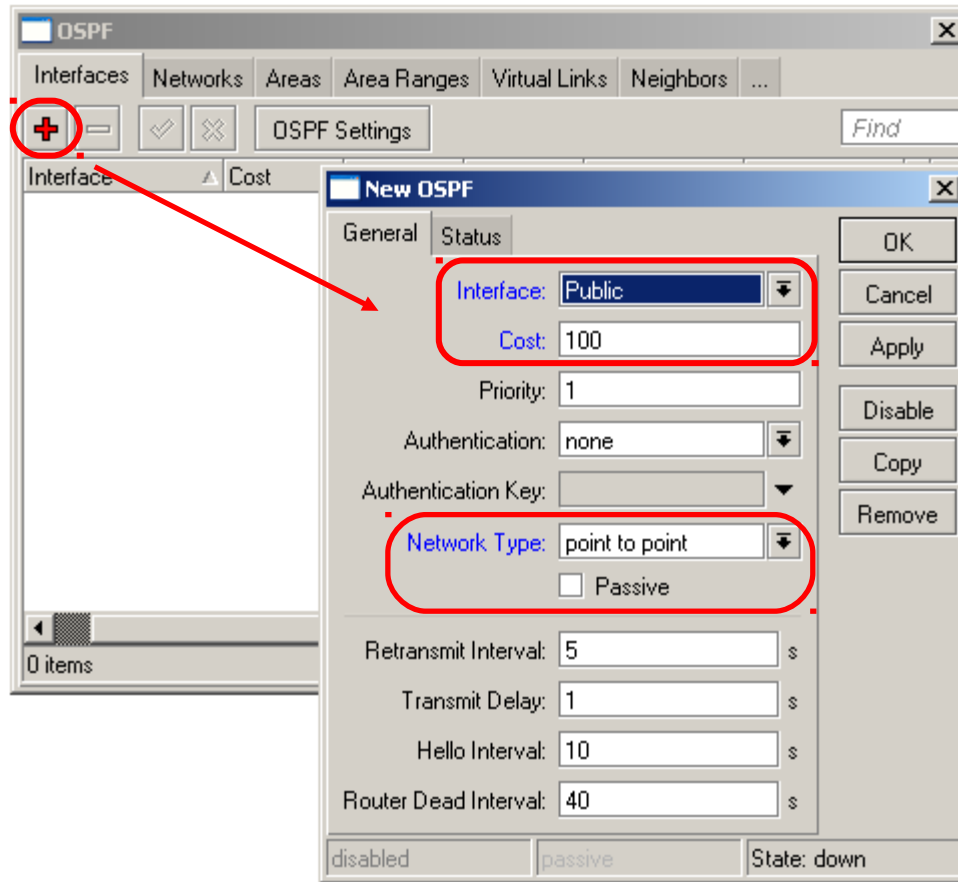

External Type 2 Metrics

Redistribution Lab

- Enable type 1 redistribution for all connected routes
- Take a look at the routing table
- Add one static route to 172.16.XY.0/24 network
- Enable type 1 redistribution for all static routes
- Take a look at the routing table

Interface Cost

- All interfaces have default cost of 10
- To override default setting you should add new entry in interface menu

- Choose correct network type for the interface

Designated Routers

- To reduce OSPF traffic in NBMA and broadcast networks, a single source for routing updates was introduced - Designated Router (DR)
- DR maintains a complete topology table of the network and sends the updates to the others
- Router with the highest priority (previous slide) will be elected as DR
- Router with next priority will be elected as Backup DR (BDR)
- Router with priority 0 will never be DR or BDR

OSPF Interface Lab

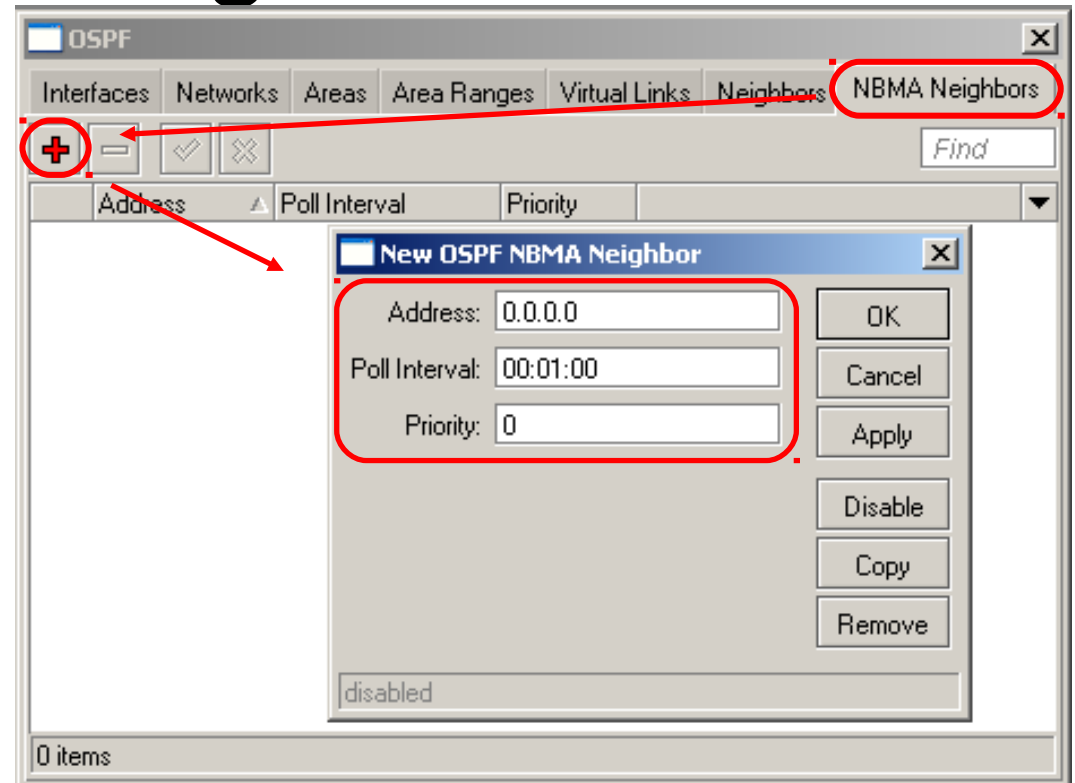

- Choose correct network type for all OSPF interfaces
- Assign costs (next slide) to ensure one way traffic in the area
- Check your routing table for ECMP routes
- Assign necessary costs so backup link will be used only when some other link fails
- Check OSPF network redundancy!
- Ensure ABR to be DR your area, but not in backbone area

Costs

NBMA Neighbors

- For non-broadcast networks it is necessary to specify neighbors manually

- The priority determines the neighbor chance to be elected as a Designated router

Stub Area

New OSPF Area

Area Name:

Area ID:

Type:

Translator Role:

Authentication:

Inject Summary LSA

Default Cost:

Interfaces:

Active Interfaces:

Neighbors:

Adjacent Neighbors:

disabled

Buttons: OK, Cancel, Apply, Disable, Copy, Remove

- A stub area is an area which does not receive AS external routes.
- Typically all routes to external AS networks can be replaced by one default route. - this route will be created automatically distributed by ABR

Stub area (2)

- «Inject Summary LSA» option allows to collect separate backbone or other area router Link State Advertisements (LSA) and inject it to the stub area
- Enable «Inject Summary LSA» option only on ABR
- «Inject Summary LSA» is not a route aggregation
- «Inject Summary LSA» cost is specified by«Default area cost» option

Not-So-Stubby Area (NSSA)

New OSPF Area

Area Name: area1

Area ID: 0.0.0.0

Type: nssa

Translator Role: translate never

Authentication: translate always, translate candidate, translate never

Default Cost: 1

Interfaces: 0

Active Interfaces: 0

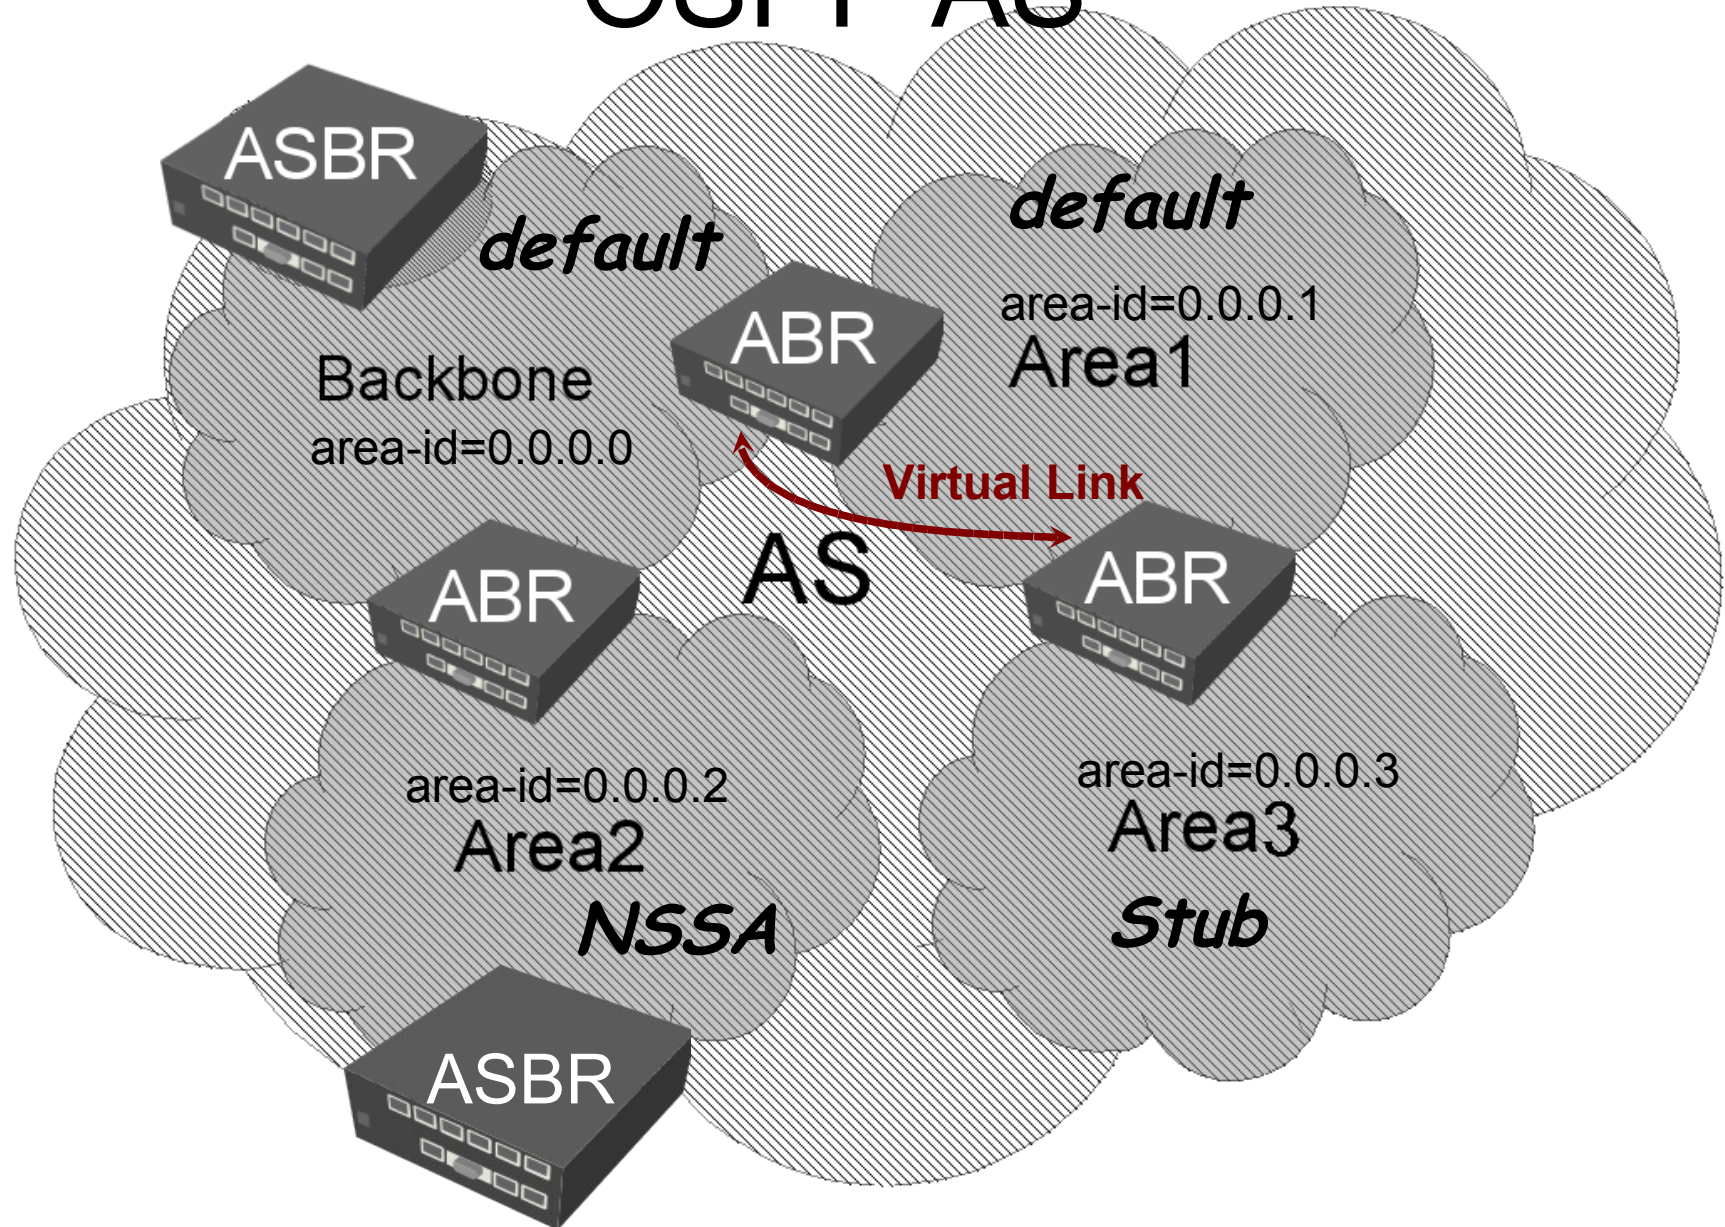

Neighbors: 0

Adjacent Neighbors: 0

disabled

- NSSA is a type of **stub area** that is able to transparently inject AS external routes to the backbone.
- «Translator role» option allow to control which ABR of the NSSA area will act as a relay from ASBR to backbone area

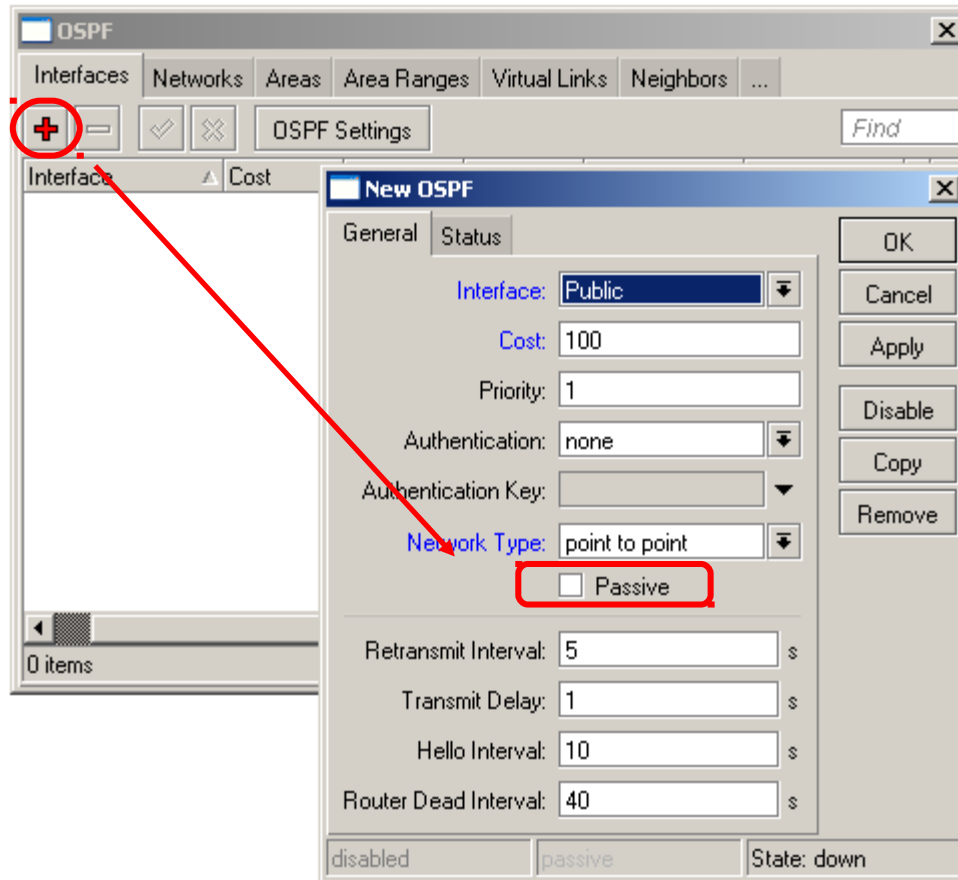

OSPF AS

Area Type Lab

- Set your area type to «stub»
- Check your routing table for changes!
- Make sure that default route redistribution on the ABR is set to «never»
- Set «Inject Summary LSA» option
 - ◆ on the ABR to «enable»
 - ◆ on the IR to «disable»

Passive interface

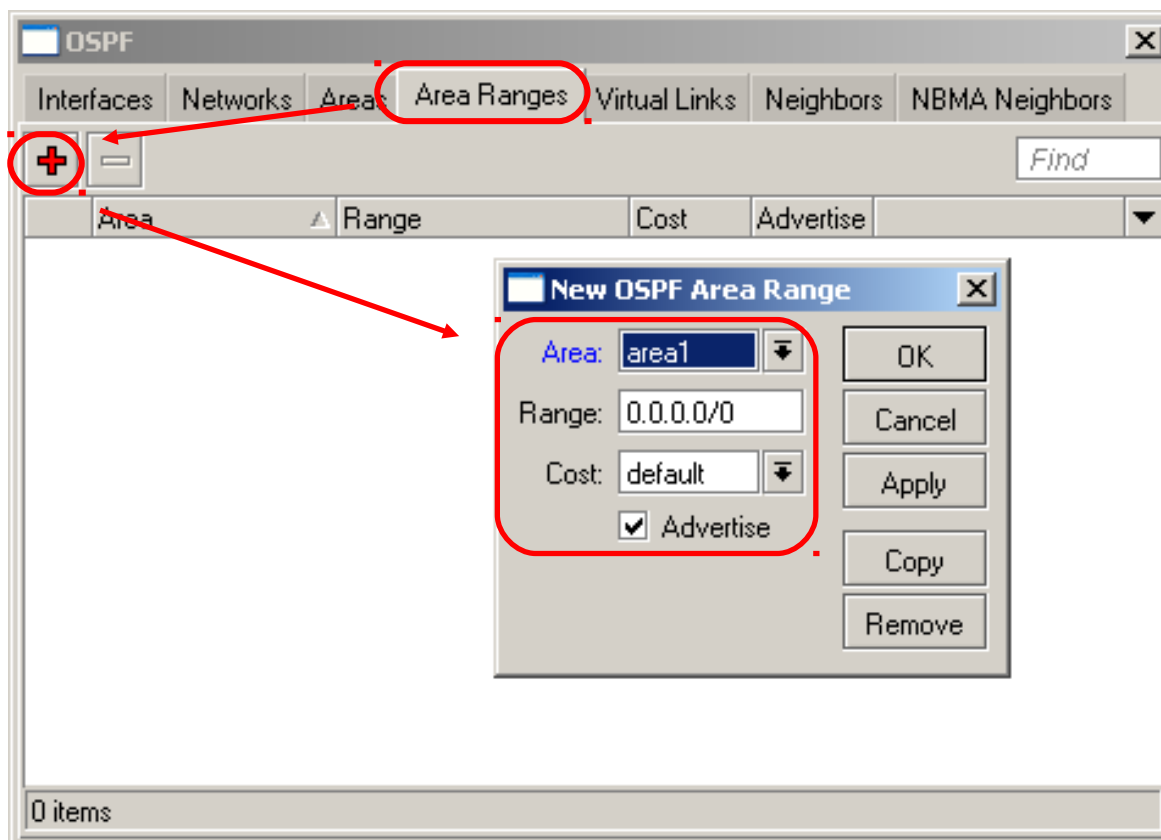

- It is necessary to assign client networks to the area or else stub area will consider those networks as external.
- It is a security issue!!!

- Passive option allow you to disable OSPF “Hello” protocol on client interfaces

Area Ranges

- Address ranges are used to aggregate (replace) network routes from within the area into one single route or delete them
- It is possible to assign specific cost to aggregate route

Route Aggregation Lab

- Advertise only one 192.168.Z.0/24 route instead of four /26 (192.168.Z.0/26, 192.168.Z.64/26, 192.168.Z.128/26, 192.168.Z.192/26) into the backbone
- Stop advertising backup network to the backbone
- Check the Main AP's routing table

Summary

- For securing your OSPF network
 - ◆ Use authentication keys (for interfaces and areas)
 - ◆ Use highest priority (255) to designated router
 - ◆ Use correct network types for the area
- To increase performance of OSPF network
 - ◆ Use correct area types
 - ◆ Use route aggregation as much as possible

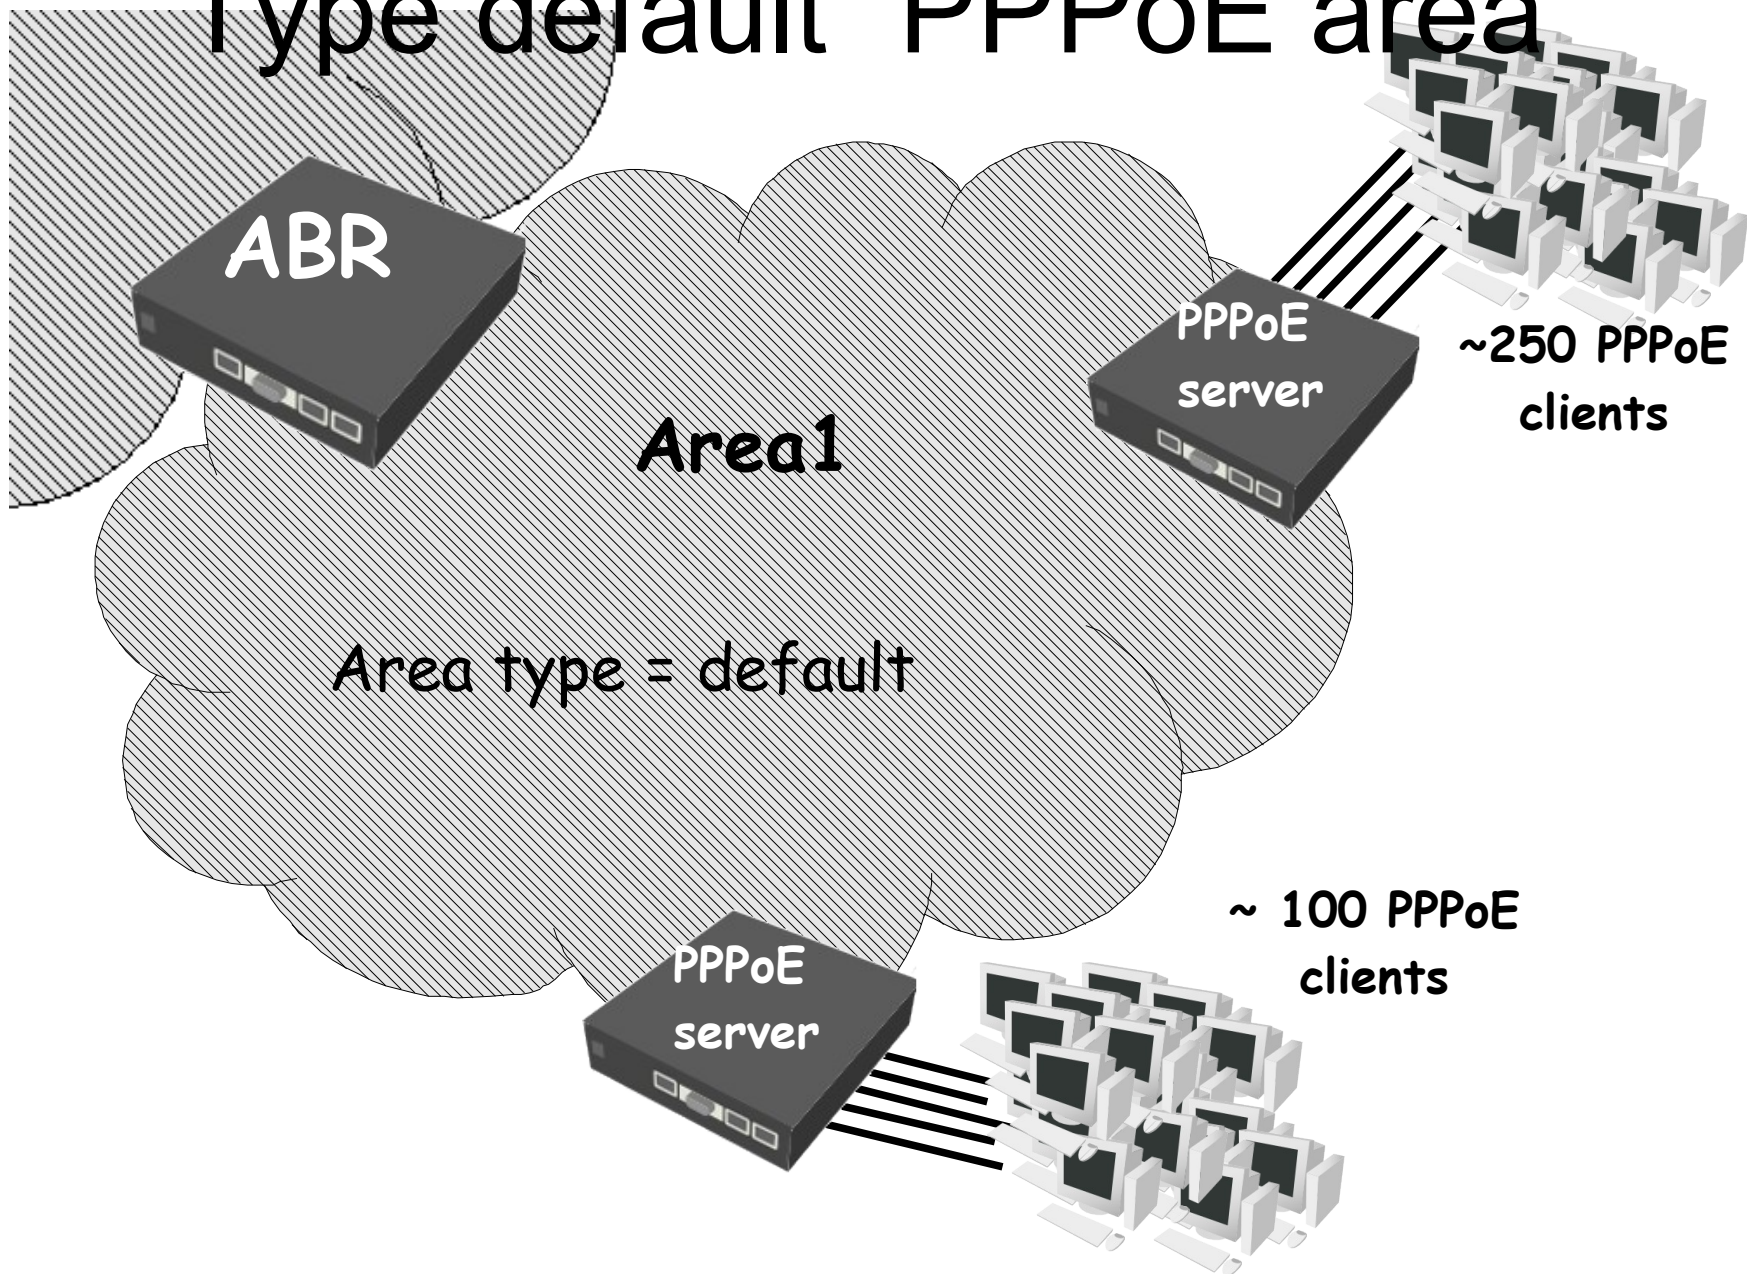

OSPF and Dynamic VPN Interfaces

- Each dynamic VPN interface
 - ◆ creates a new /32 Dynamic, Active, Connected (DAC) route in the routing table when appears
 - ◆ removes that route when disappears
- Problems:
 - ◆ Each of these changes results in OSPF update, if redistribute-connected is enabled (update flood in large VPN networks)
 - ◆ OSPF will create and send LSA to each VPN interface, if VPN network is assigned to any OSPF area (slow performance)

Type stub “PPPoE area”

Type default “PPPoE area”

“PPPoE area” Lab (discussion)

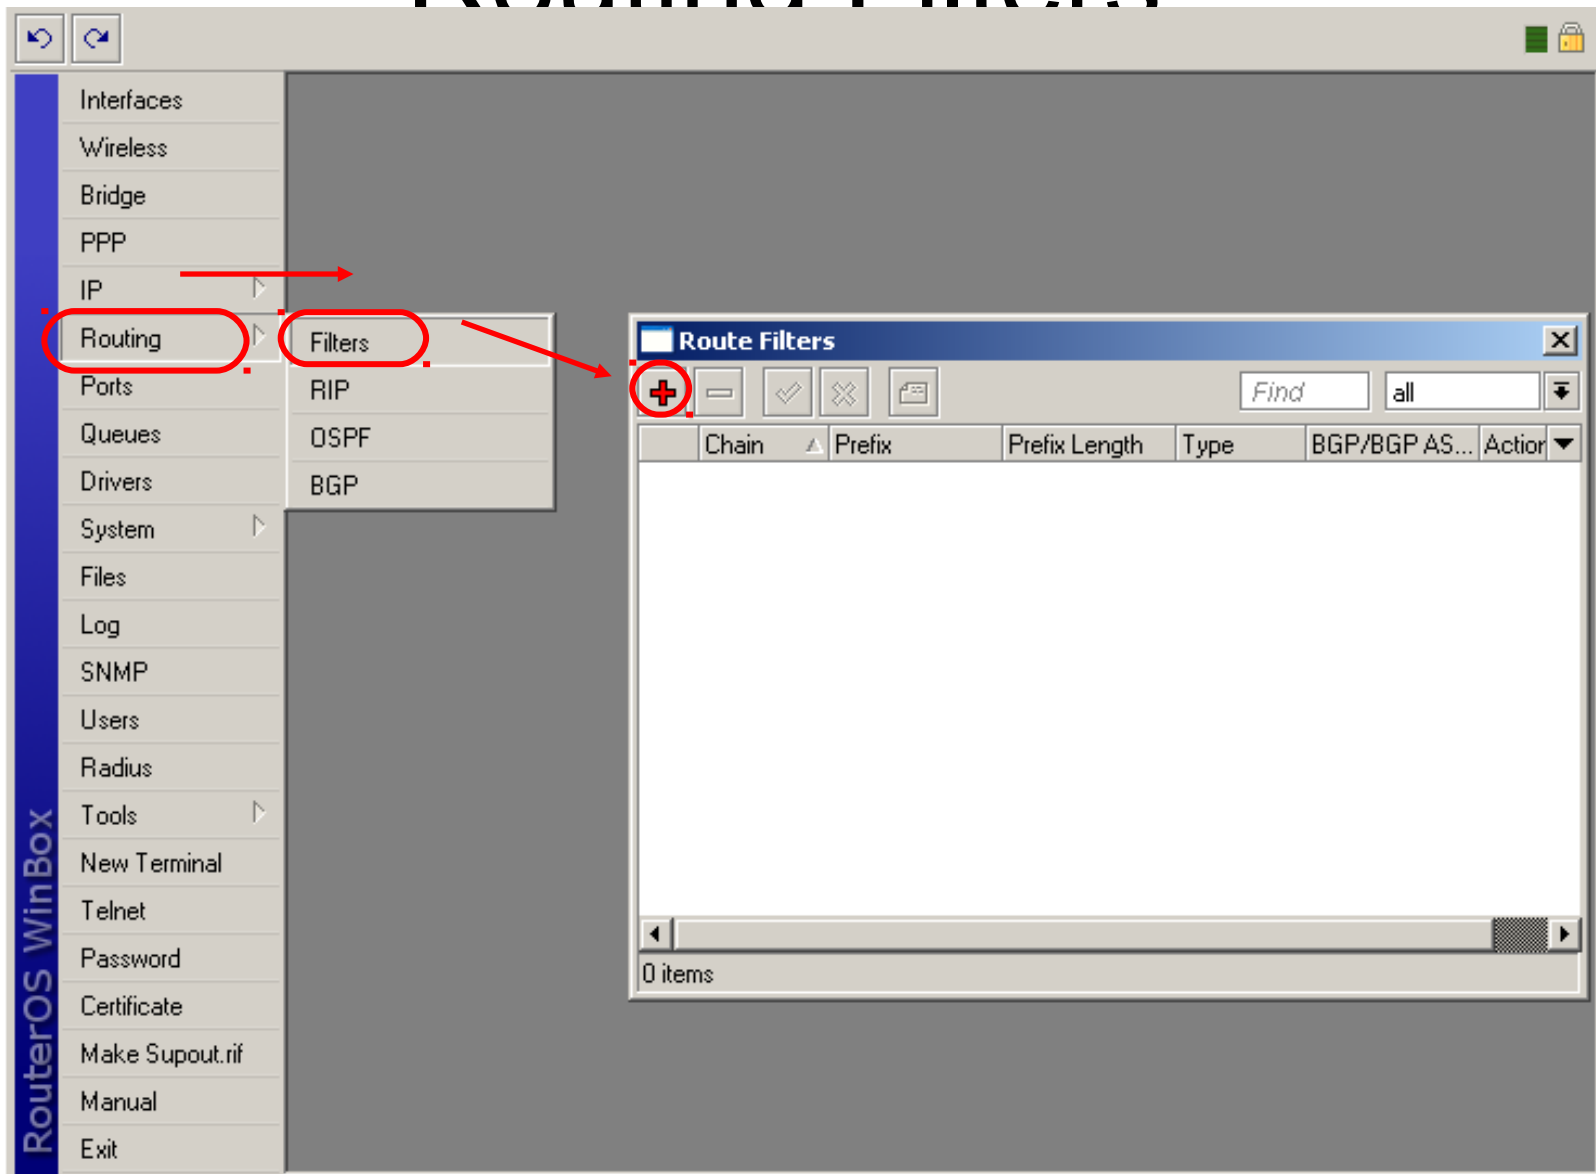

- Give a solution for each problem mentioned previously if used area type is “stub”

- Try to find a solution for each problem mentioned previously if used area type is “default”

OSPF Routing Filters

- The routing filters may be applied to incoming and outgoing OSPF routing update messages
 - Chain “ospf-in” for all incoming routing update messages
 - Chain “ospf-out” for all outgoing routing update messages
- Routing filters can manage only **external** OSPF routes (routes for the networks that are **not** assigned to any OSPF area)

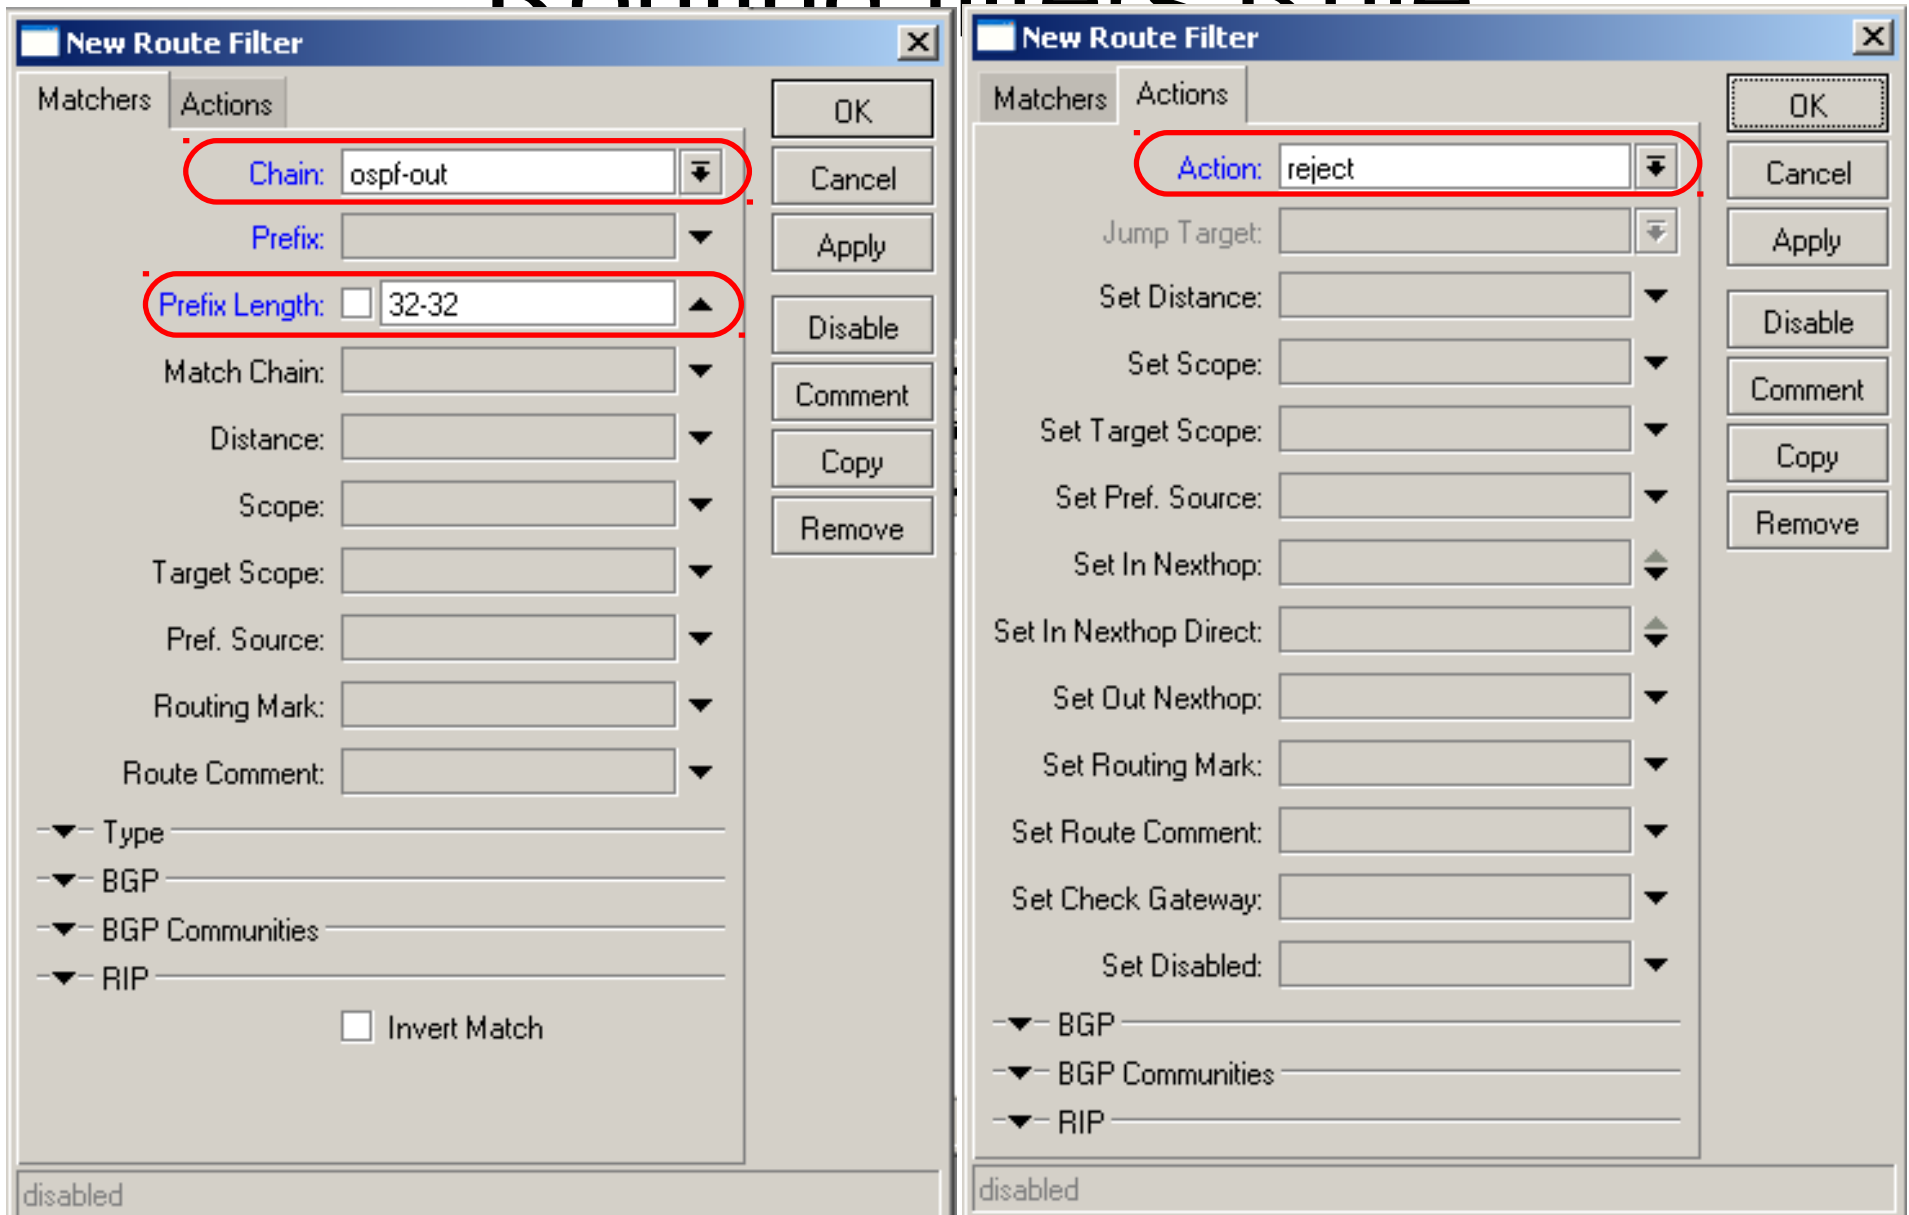

Routing Filters

Routing Filters and VPN

- It is possible to create a routing filter rule to restrict all /32 routes from getting into the OSPF
- It is necessary to have one aggregate route to this VPN network :
 - By having address from the aggregate VPN network to the any interface of the router
 - Suggestion: place this address on the interface where VPN server is running
 - Suggestion: use network address, the clients will not be able to avoid your VPN service then
 - By creating static route to the router itself

Routing filters Rule

Routing and point-to-point interface

VLAN, IPIP, EOIP, point-to-point addressing

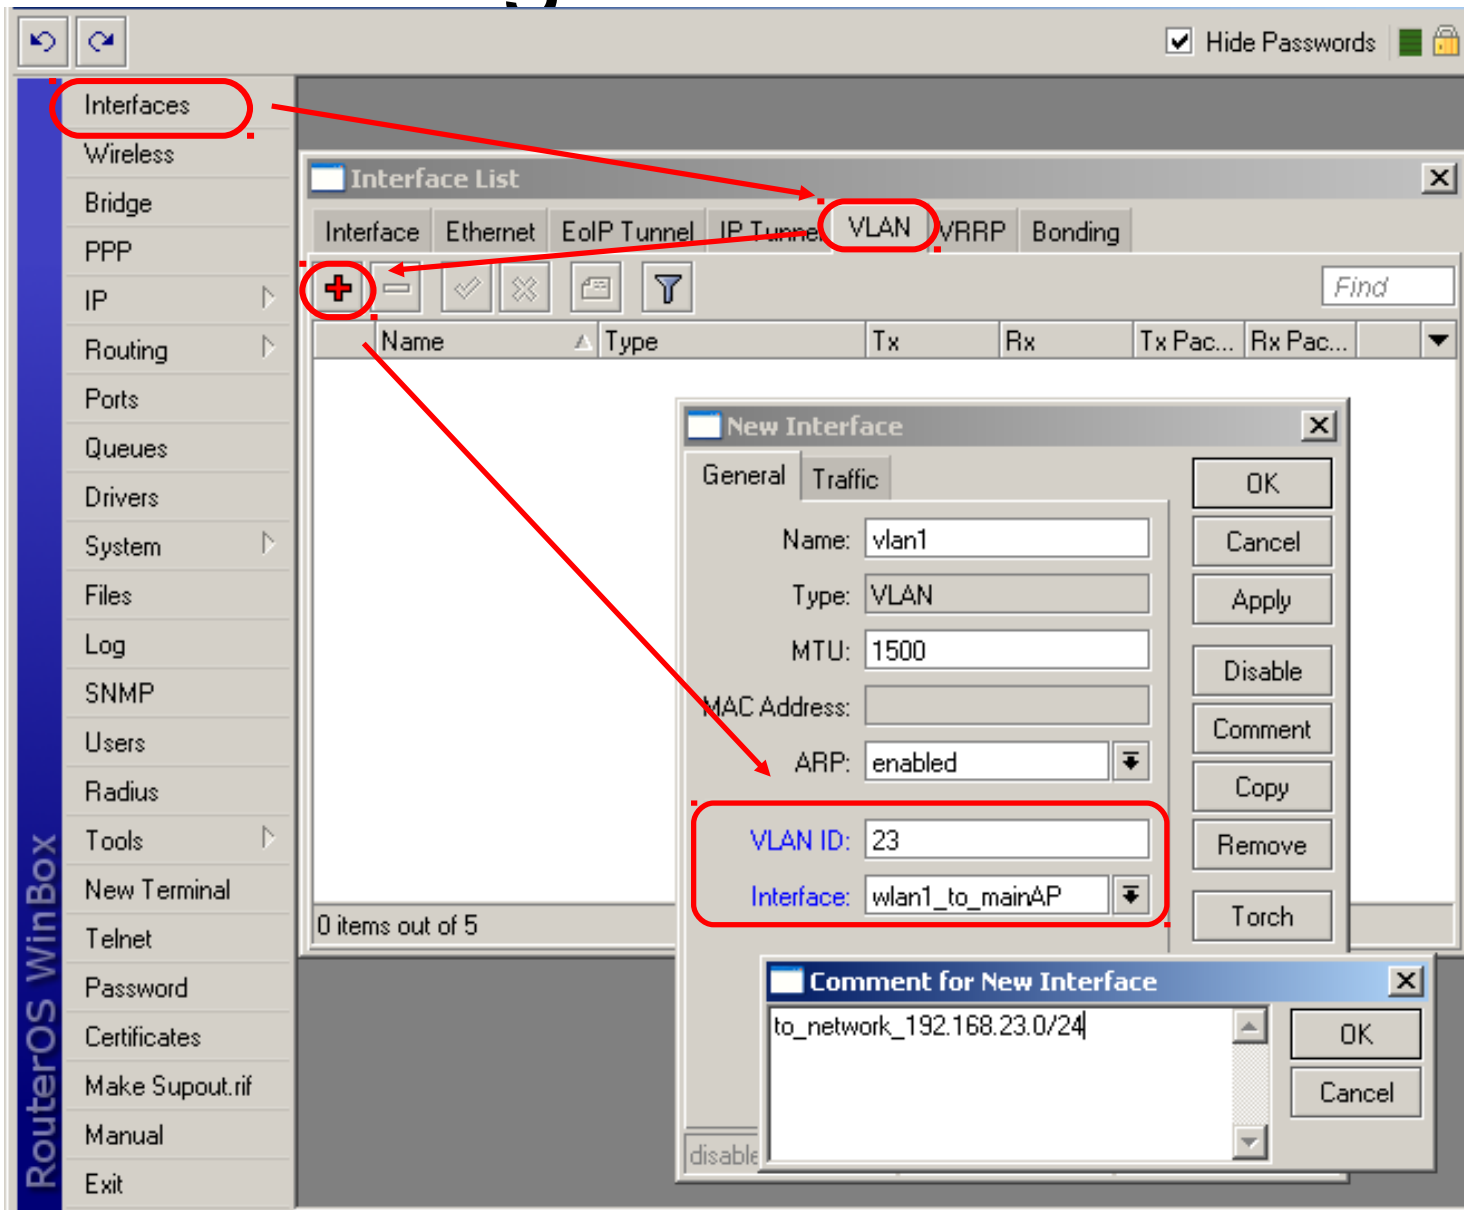

Virtual LAN (802.1Q)

- Virtual LAN (VLAN) allows network devices to be grouped into independent subgroups even if they are located on the same LAN segment
- For routers to communicate the VLAN ID must be the same for VLAN interfaces
- Ports on the router supports multiple (up to 250) Virtual LANs on a single ethernet interface
- VLAN can be configurated over other VLAN interface - “Q-in-Q” (from 802.1Q)

VLAN Example

Creating VLAN Interface

VLAN on Switch

- VLAN-compliant switch ports can be assigned to one or several groups based on VLAN tag
- Switch port in each group can be set to
 - ◆ Tagged mode – allows to add group's VLAN tag on transmit and allows to receive frames with this tag
 - ◆ Untagged mode – allows to remove this group VLAN tag on transmit, and allows to receive only untagged packets
 - ◆ <Undefined> – port have no relation to this group
- Trunk port - tagged port for several VLAN groups

VLAN Lab

- Restore default backup
- Create the group of 4
- Connect together using wireless - one AP, 3 clients
- Create VLAN link to each participant
- Assign /30 networks to VLAN links and check them

IPIP

- IP protocol 4/IPIP allows to create tunnel by encapsulating IP packets in IP packets and sending over to another router
- IPIP is Layer-3 tunnel – it can not be bridged
- RouterOS implements IPIP tunnels according to RFC 2003 – it should be compatible with other vendor IPIP implementations
- To create a tunnel you must specify address of the local and remote router on both sides of the tunnel

Creating IPIP Interface

The screenshot displays the Mikrotik WinBox interface. On the left is a vertical menu with various system and network configuration options. The main window is titled 'Interface List' and shows a table of interfaces. A red circle highlights the '+' icon in the toolbar, which is used to add a new interface. Another red circle highlights the 'IP Tunnel' tab in the toolbar. A third red circle highlights the 'Local Address' and 'Remote Address' fields in the 'New Interface' dialog box, which are set to 10.1.1.100 and 10.1.1.101 respectively. The dialog box also shows the name 'ipip1' and type 'IP Tunnel'.

IPIP Lab

- Replace all VLANs (from previous lab) with IPIP tunnels
- Check that you are able to ping remote address before creating a tunnel to it
- Assign /30 IP addresses (from previous lab) to IPIP interfaces and check all tunnels

/30 Addressing

Point-to-point Addressing

- Point-to-point addressing utilizes only two IPs per link while /30 utilizes four IPs
- There is no broadcast address, but network address must be set manually to the opposite IP address. Example:
 - ➔Router1: address=1.1.1.1/32, network=2.2.2.2
 - ➔Router2: address=2.2.2.2/32, network=1.1.1.1
- There can be identical /32 addresses on the router – each address will have different connected route

Point-to-point Addressing

Addressing Lab

- Replace all /30 addresses on IPIP interfaces (from previous lab) with /32 point-to-point addresses.
- Ensure that every other participant will be able to ping you by IP address XY.XY.XY.XY via all IPIP tunnels
- Analyse how much IP addresses were utilized on IPIP tunnels for whole group setup!

Ethernet Over IP (EOIP) Tunnel

- IP protocol 47/GRE allows to create tunnel by encapsulating Ethernet frames in IP packets and sending over to another router
- MikroTik proprietary protocol
- EOIP is Layer-2 tunnel – it can be bridged
- To create a tunnel you must specify remote router's address and choose unique Tunnel ID
- Check that your EOIP interface have different MAC-address than on opposite side.

Creating EoIP Tunnel

The screenshot shows the Mikrotik WinBox interface. On the left, the 'RouterOS WinBox' sidebar is visible with various menu items. The 'Interfaces' menu is highlighted. In the main window, the 'Interface List' dialog is open, showing a table with columns for Name, Type, Tx, Rx, Tx Pac..., and Rx Pac... The 'EoIP Tunnel' tab is selected. A red circle highlights the '+' icon in the toolbar. A 'New Interface' dialog is open, showing the following fields:

- Name: eoip-tunnel1
- Type: EoIP Tunnel
- MTU: 1500
- MAC Address: 02:C8:BA:EA:41:05
- ARP: enabled
- Remote Address: 10.1.1.23
- Tunnel ID: 23

Buttons for OK, Cancel, Apply, Disable, Comment, Copy, Remove, and Torch are visible on the right side of the dialog. The status bar at the bottom shows 'disabled', 'running', and 'slave'.

EOIP and Bridging

EoIP Lab

- Replace all IPIP tunnels (from previous lab) with EoIP tunnels
- Check that you are able to ping remote address before creating a tunnel to it
- Bridge all EoIP interfaces with local interface
- Check Winbox Loader neighbour discovery feature (“...” button)
